## OmROח

## Programmable Digital Controller E5AR-T E5ER-T

User's Manual

## Introduction

OMRON products are manufactured for use according to proper procedures by a qualified operator and only for the purposes described in this manual.
This manual describes the functions, performance, and application methods needed for optimum use of the E5AR-T/ER-T Programmable Digital Controllers.

Please observe the following items when using the E5AR-T/ER-T Programmable Digital Controllers.

- This product is designed for use by qualified personnel with a knowledge of electrical systems.
- Read this manual carefully and make sure you understand it well to ensure that you are using the E5AR-T/ER-T Programmable Digital Controllers correctly.
- Keep this manual in a safe location so that it is available for reference when required.

## Precautions on Using the Product

Before using the Controller under the following conditions, make sure that the ratings and performance characteristics of the Controller are sufficient for the systems, machines, and equipment, and be sure to provide the systems, machines, and equipment with double safety mechanisms, and also consult your OMRON representative.

- Using the Controller under conditions which are not described in the manual
- Applying the Controller to nuclear control systems, railroad systems, aviation systems, vehicles, combustion systems, medical equipment, amusement machines, safety equipment, and other systems, machines, and equipment
- Applying the Controller to systems, machines, and equipment that may have a serious influence on lives and property if used improperly, and especially require safety

## Notice

(1) All rights reserved. No part of this manual may be reprinted or copied without the prior written permission of OMRON.
(2) The specifications and other information in this manual are subject to change without notice for purposes of improvement.
(3) Considerable care has been taken in the preparation of this manual; however, OMRON assumes no responsibility or liability for any errors or inaccuracies that may appear. In the event that a problem is discovered, please contact one of the OMRON offices or agents listed at the end of the manual, and provide the catalogue number shown on the cover of the manual.

## Terms and Conditions Agreement

## Read and understand this Manual

Please read and understand this catalog before purchasing the products. Please consult your OMRON representative if you have any questions or comments.

## Warranty, Limitations of Liability

## Warranties

## - Exclusive Warranty

- Limitations OMRON MAKES NO WARRANTY OR REPRESENTATION, EXPRESS OR
- Buyer Remedy Omron's sole obligation hereunder shall be, at Omron's election, to (i) replace (in the form originally shipped with Buyer responsible for labor charges for removal or replacement thereof) the non-complying Product, (ii) repair the non-complying Product, or (iii) repay or credit Buyer an amount equal to the purchase price of the noncomplying Product; provided that in no event shall Omron be responsible for warranty, repair, indemnity or any other claims or expenses regarding the Products unless Omron's analysis confirms that the Products were properly handled, stored, installed and maintained and not subject to contamination, abuse, misuse or inappropriate modification. Return of any Products by Buyer must be approved in writing by Omron before shipment. Omron Companies shall not be liable for the suitability or unsuitability or the results from the use of Products in combination with any electrical or electronic components, circuits, system assemblies or any other materials or substances or environments. Any advice, recommendations or information given orally or in writing, are not to be construed as an amendment or addition to the above warranty.

See http://www.omron.com/global/ or contact your Omron representative for published information.

## Limitation on Liability; Etc

Omron's exclusive warranty is that the Products will be free from defects in materials and workmanship for a period of twelve months from the date of sale by Omron (or such other period expressed in writing by Omron). Omron disclaims all other warranties, express or implied. IMPLIED, ABOUT NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OF THE PRODUCTS. BUYER ACKNOWLEDGES THAT IT ALONE HAS DETERMINED THAT THE PRODUCTS WILL SUITABLY MEET THE REQUIREMENTS OF THEIR INTENDED USE.
Omron further disclaims all warranties and responsibility of any type for claims or expenses based on infringement by the Products or otherwise of any intellectual property right.

OMRON COMPANIES SHALL NOT BE LIABLE FOR SPECIAL, INDIRECT, INCIDENTAL, OR CONSEQUENTIAL DAMAGES, LOSS OF PROFITS OR PRODUC- TION OR COMMERCIAL LOSS IN ANY WAY CONNECTED WITH THE PRODUCTS, WHETHER SUCH CLAIM IS BASED IN CONTRACT, WARRANTY, NEGLIGENCE OR STRICT LIABILITY.

Further, in no event shall liability of Omron Companies exceed the individual price of the Product on which liability is asserted.

## Application Considerations

Suitability of Use

Omron Companies shall not be responsible for conformity with any standards, codes or regulations which apply to the combination of the Product in the Buyer's application or use of the Product. At Buyer's request, Omron will provide applicable third party certification documents identifying ratings and limitations of use which apply to the Product. This information by itself is not sufficient for a complete determination of the suitability of the Product in combination with the end product, machine, system, or other application or use. Buyer shall be solely responsible for determining appropriateness of the particular Product with respect to Buyer's application, product or system. Buyer shall take application responsibility in all cases.

NEVER USE THE PRODUCT FOR AN APPLICATION INVOLVING SERIOUS RISK
TO LIFE OR PROPERTY WITHOUT ENSURING THAT THE SYSTEM AS A WHOLE HAS BEEN DESIGNED TO ADDRESS THE RISKS, AND THAT THE OMRON PRODUCT(S) IS PROPERLY RATED AND INSTALLED FOR THE INTENDED USE WITHIN THE OVERALL EQUIPMENT OR SYSTEM.

Programmable Omron Companies shall not be responsible for the user's programming of a proProducts grammable Product, or any consequence thereof.

## Disclaimers

Performance Data

Change in Specifications

Data presented in Omron Company websites, catalogs and other materials is provided as a guide for the user in determining suitability and does not constitute a warranty. It may represent the result of Omron's test conditions, and the user must correlate it to actual application requirements. Actual performance is subject to the Omron's Warranty and Limitations of Liability.

Product specifications and accessories may be changed at any time based on improvements and other reasons. It is our practice to change part numbers when published ratings or features are changed, or when significant construction changes are made. However, some specifications of the Product may be changed without any notice. When in doubt, special part numbers may be assigned to fix or establish key specifications for your application. Please consult with your Omron's representative at any time to confirm actual specifications of purchased Product.

Information presented by Omron Companies has been checked and is believed to be accurate; however, no responsibility is assumed for clerical, typographical or proofreading errors or omissions.

## Precautions

## Definition of Safety Notices and Information

The following notation is used in this manual to provide precautions required to ensure safe usage of the product.

The safety precautions that are provided are extremely important to safety. Always read and heed the information provided in all safety precautions.

The following notation is used.

## $\triangle$ Caution

Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury or in property damage.

## Symbols

| Symbol |  | Meaning |
| :--- | :--- | :--- |
| Caution |  | General Caution <br> Indicates non-specific general cautions, warn- <br> ings, and dangers. |
| Prohibition |  | Electrical Shock Caution <br> Indicates possibility of electric shock under spe- <br> cific conditions. |
| Mandatory |  |  |
| Caution |  | General Prohibition <br> Indicates non-specific general prohibitions. |

## Precautions

## $\triangle$ CAUTION

Do not touch the terminals while power is being supplied.
Doing so may occasionally result in minor injury due to electric shock.

Do not touch the terminals or the electronic components or patterns on the PCB within 1 minute after turning OFF the power supply. Doing so may occasionally result in minor injury due to electric shock.

Do not allow pieces of metal, wire clippings, or fine metallic shavings or filings from installation to enter the product. Doing so may occasionally result in electric shock, fire, or malfunction.

Do not use the product in locations where flammable or explosive gases are present. Doing so may occasionally result in minor or moderate explosion, causing minor or moderate injury, or property damage.

Do Not disassemble, modify, or repair the product or touch any of the internal parts. Minor electric shock, fire, or malfunction may occasionally occur.

Tighten the screws on the terminal block to the following specified torque. Loose screws may occasionally cause fire, resulting in minor or moderate injury, or damage to the equipment.
Terminal block screws: 0.40 to $0.56 \mathrm{~N} \cdot \mathrm{~m}$
Perform correct setting of the product according to the application. Failure to do so may occasionally cause unexpected operation, resulting in minor or moderate injury, or damage to the equipment.

A malfunction in the Product may occasionally make control operations impossible or prevent alarm outputs, occasionally resulting in property damage to the system or equipment connected to the Product. To maintain safety in the event of malfunction of the Product, take appropriate safety measures, such as installing a monitoring device in a separate system.

Do not use the equipment for measurements within measurement categories II, III, or IV (according to IEC61010-1). Doing so may occasionally cause unexpected operation, resulting in minor or moderate injury, or damage to the equipment. Use the equipment for measurements only within the measurement categories for which the product is designed.

The service life of the output relays depends on the switching capacity and switching conditions. Consider the actual application conditions and use the product within the rated load and electrical service life. Using the product beyond its service life may occasionally result in contact welding or burning.

## Precautions for Safe Use

(1) Use and store the Digital Controller in the range of specifications for ambient temperature and humidity. The service life will decrease due to increased internal temperature if multiple Digital Controllers are mounted closely side by side or one on top of the other. If this type of mounting is used, use forced cooling, e.g., use a fan to blow air onto the Digital Controllers.
(2) Do not prevent heat dissipation by obstructing the periphery of the Digital Controller. Do not block the vents on the Digital Controller unit.
(3) The supplied power voltage and load must be within the rated and specified ranges.
(4) Be sure to confirm the name and polarity for each terminal before wiring the terminal block.
(5) Do not connect anything to unused terminals.
(6) Use the specified size of crimp terminals (M3, width: 5.8 mm max.) to wire the terminal block. When connecting bare wires, use copper stranded or solid wires, and use AWG22 (cross-sectional area of $0.326 \mathrm{~mm}^{2}$ ) to AWG14 (crosssectional area of $2.081 \mathrm{~mm}^{2}$ ) for the power supply terminals and AWG28 (cross-sectional area of $0.081 \mathrm{~mm}^{2}$ ) to AWG16 (cross-sectional area of 1.309 $\mathrm{mm}^{2}$ ) for other terminals. (Length of exposed wire: 6 to 8 mm )
(7) Ensure that the rated voltage is attained within 2 seconds after turning ON the power.
(8) Turn OFF the power first when you need to draw out the Digital Controller. Do Not touch the terminals or the electronic components, or subject them to physical shock. When inserting the Digital Controller, do not allow the electronic components to contact the case.
(9) Do not remove the inner circuit board.
(10) The output may turn OFF when shifting to certain levels. Take this into consideration when performing control.
(11) Allow a warm-up time of at least 30 minutes.
(12) To prevent inductive noise, separate the Digital Controller terminal block wiring from power lines that carry high voltages or high currents. Also, do not wire power lines together with or parallel to the Digital Controller wiring. Using shielded cables and separate conduits or ducts is recommended.
Attach a surge suppressor or noise filter to peripheral devices that generate noise (in particular, motors, transformers, solenoids, magnetic coils, or other equipment that has an inductive component). When a noise filter is used at the power supply, first check the voltage or current, and attach the noise filter as close as possible to the product. Allow as much space as possible between the product and devices that generate powerful high frequencies (e.g., highfrequency welders, high-frequency sewing machines) or surge.
(13) Install a switch or circuit breaker that allows the operator to immediately turn OFF the power, and label suitably.
(14) The product is designed for indoor use only.

Do not use the product outdoors or in any of the following locations.

- Locations where dust or corrosive gas is present (in particular, sulfur or ammonia gases)
- Locations where condensation or ice may form
- Locations directly exposed to sunlight
- Locations subject to strong shocks or vibration
- Locations where water or oil may splatter on the Digital Controller
- Locations directly exposed to radiant heat from heating equipment
- Locations subject to sudden or extreme changes of temperature
(15) Do not use paint thinner or similar chemical to clean with. Use standard grade alcohol.

## Precautions for Correct Use

## - Service Life

Use the product within the following temperature and humidity ranges:

> Temperature: -10 to $55^{\circ} \mathrm{C}$ (no icing or condensation) Humidity: $25 \%$ to $85 \%$

When the product is installed inside a control panel, make sure that the temperature around the product, not the temperature around the control panel, does not exceed $55^{\circ} \mathrm{C}$.

The service life of this product and similar electronic devices is determined not only by the number of switching operations of relays but also by the service life of internal electronic components. Component service life is affected by the ambient temperature: the higher the temperature becomes, the shorter the service life becomes and, the lower the temperature becomes, the longer the service life becomes. Therefore, the service life can be extended by lowering the temperature of the product.
Be sure to install the product according to the specified conditions. Otherwise, the heat generated by the product will cause the internal temperature to rise, shortening the service life. If necessary, cool the product using fans or other means of air ventilation.
When providing forced cooling, however, be careful not to cool down the terminals sections alone to avoid measurement errors.

## - Noise Countermeasures

To prevent inductive noise, separate the wiring for the product's terminal block and connector from high-voltage, high-current power lines. Do not run the wiring parallel to or in the same cable as power lines. The influence of noise can also be reduced by using separate wiring ducts or shield lines.
Install surge absorbers or noise filters in devices near the product that generate noise (in particular, devices with an inductance component, such as motors, transformers, solenoids, and magnetic coils).

If a noise filter is used for the power supply, check the voltage and current, and install the noise filter as close as possible to the product.
Separate the product as far as possible from devices generating strong highfrequency noise (e.g., high-frequency welders and high-frequency sewing machines) or surges.

## - Measurement Accuracy

When extending the thermocouple lead wire, be sure to use a compensating wire that matches the thermocouple type.
When extending the lead wire of the platinum resistance thermometer, be sure to use wires that have low resistance, and make sure that the resistances of the three lead wires are the same.
If the measurement accuracy is low, check whether the input shift is set correctly.

## - Waterproofing

The degree of protection is as shown below.

| Front panel | NEMA 4x indoor use |
| :--- | :--- |
| Rear case | IP20 |
| Terminals | IP00 |

## About this Manual

## - Special Notation

(1) Important
"Important" appears where incorrect settings or operation will prevent a function from achieving the expected result.

Set the input type before setting the scaling value. If the input type is changed after setting the scaling value, the scaling value will be automatically initialized.
(2) Hint
"Hint" gives useful hints, advice, and other supplemental information.

## Hint

Overshooting can be adjusted using the external interference overshoot adjustment function when there is excessive overshooting in temperature control (i.e., in response to external interference).
(3) Notation used to indicate various information on parameters ("Function," "Setting," "Monitor," and "Reference") are explained in Section 8 Parameters.

## Abbreviations

Abbreviations used in the parameters, illustrations, and text are listed in the following table.

| Abbreviation | Meaning | Abbreviation | Meaning |
| :---: | :---: | :---: | :---: |
| PV | Present value | ch | Channel |
| SP | Set point | CH | Channel |
| SV | Set value | PSP | Program SP |
| AT | Auto-tuning | RSP | Remote SP |
| EU | Engineering units* | FSP | Fixed SP |

[^0]
## - Notation Used for Settings

Letters, numbers, and abbreviations in settings that appear on the E5AR-T/ER-T display are as follows:

| H | $\square$ | 5 | $d$ | $E$ | $F$ | $\underline{\square}$ | H | $こ$ | - | - | $!$ | $\therefore$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| A | B | C | D | E | F | G | H | I | J | K | L | M |

| 9 | $\square$ | $p$ | 9 | , | 5 | $t$ | U | $\square$ | $\underline{\square}$ | - | $\square$ | 三 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| N | 0 | P | Q | R | S | T | U | V | W | X | Y | Z |

| $\mathbf{a}$ | $\mathbf{1}$ | $\mathbf{\Xi}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{5}$ | $\mathbf{7}$ | $\mathbf{g}$ | $\mathbf{g}$ | $-\mathbf{1}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | -1 (Most signif- <br> icant digit) |

## - Revision History

The revision code of this manual is given at the end of the catalog number at the bottom left of the back cover. The following table outlines the changes made to the manual during each revision. Page numbers refer to the previous version.

Cat. No. $\quad$ H201-E1-03

| Revision code | Date | Pages and changes |
| :--- | :--- | :--- |
| 01 | September 2006 | Original production |
| 02 | November 2010 | The wording for voltage outputs was changed from "pulses" to "for driving SSR" throughout the <br> manual. <br> Page 1-10: Added note. <br> Page 1-13: Changed descriptions of output 1 and output 2. <br> Pages 6-9 and 7-10: Replaced last paragraph. <br> Page A-13: Changed setting/monitor ranges for Modbus addresses 0614, 0616, 0618, and <br> 061A. Deleted note 5 and added reference to note 5. <br> Page A-14: Changed setting/monitor range for Modbus addresses 1824. Changed references <br> from note 6 to note 5. <br> Page A-15: Deleted note 5 and changed references from note 7 to note 6. <br> Page A-17: Deleted note 2 and changed references from note 3 to note 2. <br> Page A-21: Changed setting/monitor ranges for Modbus addresses 1904, 1906, 190A, 190C, <br> 1910, and 1912. Deleted note 4. |
| Page A-39: Changed setting/monitor ranges for CompoWay/F addresses 0011, 0012, 0014, |  |  |
| 0015, 0017, and 0018. |  |  |
| Page A-40: Changed setting/monitor range for CompoWay/F addresses 0402. |  |  |
| Page A-43: Removed note. |  |  |

## Section 1 Overview

### 1.1 Main Features of the E5AR-T and E5ER-T

The E5AR-T/ER-T is an advanced Programmable Digital Controller that features high-precision control. The E5AR-T/ER-T has the following features.

## $\square$ Inputs

## - High-speed <br> Sampling <br> - High Accuracy and <br> High Resolution

- Sampling period: 50 ms
- Indication accuracy

Thermocouple: (Larger of $\pm 0.1 \% \mathrm{PV}$ or $\left.\pm 1^{\circ} \mathrm{C}\right) \pm 1$ digit max.
Platinum resistance thermometer:
(Larger of $\pm 0.1 \% \mathrm{PV}$ or $\pm 0.5^{\circ} \mathrm{C}$ ) $\pm 1$ digit max.
Analog input: $( \pm 0.1 \%$ FS) $\pm 1$ digit max
(For non-standard specifications, refer to Appendix Specifications (P. A-2))

- Input resolution: $1 / 100^{\circ} \mathrm{C}$
(Pt100: A range of -150.00 to $150.00^{\circ} \mathrm{C}$ with a resolution of $0.01^{\circ} \mathrm{C}$ is provided.)
- High-speed sampling is achieved simultaneously with high accuracy and high resolution. This provides high-accuracy, high-speed control to match your application.
- A wide range of temperature inputs and analog inputs is supported. Temperature inputs:

Thermocouples: K, J, T, E, L, U, N, R, S, B, W
Platinum resistance thermometers: Pt100
Analog inputs:
Current inputs: 4 to 20 mA or 0 to 20 mA
Voltage inputs: 1 to $5 \mathrm{~V}, 0$ to 5 V , or 0 to 10 V

## - Multiple Inputs

Controller

- Programs
- PID Sets
- Up to 32 programs can be created containing set points, times, PID set numbers, alarm set numbers, wait upper/lower limits, segment outputs, program repetitions, and program links. The set point, times, wait function, and segment outputs can be set for each segment. Outputs can be set for each segment or outputs can be set based on the time from the start of the segment.
- Up to 8 PID sets can be created to store settings (PID constants, MV limits, and automatic selection range upper limits) for PID control.
- PID sets can be selected not only by directly specifying the PID set number in a program, but they can also be selected automatically according to the present value, deviation, or set point.

## - A wide Variety of

 Control Modes and Functions- Coordinated operation is possible with one Digital Controller for models with 2 or 4 input channels, eliminating the need for slave adjusters.
- Position-proportional Control Models support floating control or closed control. Floating control allows position-proportional control without a potentiometer.

## Outputs

- Multi-output Function
- High Resolution

## - Control Period

- Multi-outputs enable using either current outputs or voltage outputs (for driving SSRs).
- Resolution of Current Outputs

0 to 20 mA : Approx. 54,000
4 to 20 mA: Approx. 43,000

- The control period can be set as short as 0.2 seconds, allowing precise time-proportioning control for voltage outputs (for driving SSRs).

### 1.2 Part Names and Functions

## - E5ER-T

## $\square$ Interpreting the Display

- Display No. 1 Shows the present value, the parameter name, or error name (red).
- Display No. 2

Shows the set point or the set value of the parameter (green).

- Display No. 3
- Channel Indicator
- Bar Graph
- Program Status Indicators

Shows the program number, segment number, or the level name (orange).

Shows the set channel number (orange).
The channel indicator functions only on models with more than one input. It is always OFF on models with only one input.
The E5ER-T indicates the channel using the CH 2 operation indicator.
Shows a bar graph of the set item, such as the program time remaining or output level.

Shows the direction of change of the present SP of the present segment. The indicators light as follows: Rising segment: top indicator, fixed-temperature segment: middle indicator, and falling segment: bottom indicator.

- Operation Indicators

| Operation indicator | Model |  | Common/Individual channel indicator | Explanation |
| :---: | :---: | :---: | :---: | :---: |
|  | $\begin{gathered} \text { E5AR- } \\ \mathbf{T} \end{gathered}$ | $\begin{gathered} \text { E5ER- } \\ T \end{gathered}$ |  |  |
| OUT1 | $\bullet$ | $\bullet$ | Common indicators (orange) | Turns ON/OFF when control output 1 turns ON/ OFF. (See note 2.) |
| OUT2 | $\bullet$ | $\bullet$ |  | Turns ON/OFF when control output 2 turns ON/ OFF. (See note 2.) |
| OUT3 | $\bullet$ | - |  | Turns ON/OFF when control output 3 turns ON/ OFF. (See note 2.) |
| OUT4 | - | - |  | Turns ON/OFF when control output 4 turns ON/ OFF. (See note 2.) |
| SUB1 | $\bullet$ | $\bullet$ | Common indicators (red) | Turns ON/OFF when the output function assigned to auxiliary output 1 turns ON/OFF. |
| SUB2 | $\bullet$ | $\bullet$ |  | Turns ON/OFF when the output function assigned to auxiliary output 2 turns ON/OFF. |
| SUB3 | $\bullet$ | $\bullet$ |  | Turns ON/OFF when the output function assigned to auxiliary output 3 turns ON/OFF. |
| SUB4 | $\bullet$ | $\bullet$ |  | Turns ON/OFF when the output function assigned to auxiliary output 4 turns ON/OFF. |
| RST | $\bullet$ | $\bullet$ | Individual channel indicator (orange) | ON while the program is being reset. Otherwise, OFF. |
| RSP | $\bullet$ | $\bullet$ | Individual channel indicator (orange) | ON when the SP mode is set to Remote SP Mode. Otherwise, OFF. |
| HOLD | $\bullet$ | - | Individual channel indicator (orange) | ON while the program is being held. Otherwise, OFF. |
| WAIT | $\bullet$ | - | Individual channel indicator (red) | ON while the program is waiting. Otherwise, OFF. |
| FSP | $\bullet$ | $\bullet$ | Individual channel indicator (red) | ON when the SP mode is set to Fixed SP Mode. Otherwise, OFF. |
| MANU | $\bullet$ | $\bullet$ | Individual channel indicator (orange) | ON when operation is set to Manual Mode. Otherwise, OFF. |
| CMW | $\bullet$ | $\bullet$ | Common indicator (orange) | Turns ON/OFF when writing via communications is enabled/disabled. |
| CH2 | - | $\bullet$ | Individual channel indicator (orange) | ON when channel 2 is being displayed. Otherwise, OFF. |

Note 1.0: Indicates that the model supports the function.The function, however, may be disabled depending on the settings. An indicator is always OFF for a disable function.
-: Indicates that the model does not support the function.
2. When the control output is a current output, the indicator turns OFF when the MV is $0 \%$ or less and turns ON when the MV is greater than $0 \%$.

## Using the Keys

| Key | Name | $\quad$ Description |
| :---: | :---: | :--- | Level Key | Press to change setting levels. |
| :--- |

### 1.3 I/O and Main Functions

## I/O Configuration

The I/O configuration of the E5AR-T/ER-T and internal setting items are shown in the following diagram.

| PV. 1 | Channel 1 PV |
| :--- | :--- |
| RSP. 1 | Channel 1 Remote SP |
| MVH. 1 | Channel 1 MV (Heating) |
| MVL. 1 | Channel 1 MV (Cooling) |
| VLVO. 1 | Channel 1 MV (Open) |
| VLVC. 1 | Channel 1 MV (Closed) |
| CSP. 1 | Channel 1 SP for Coordinated |
|  | Operation |

| PRSP. 1 |
| :--- |
| Channel 1 |
| Program/Remote SP Mode |

PFSP. 1 Channel 1
Program/Fixed SP Mode PRG. 1 Channel 1 Program No. RNRS. 1 Channel 1 RUN/Reset MNAT. 1 Channel 1 Auto/Manual

| ALM1.1 | Channel 1 Alarm 1 |
| :--- | :--- |
| ALM2.1 | Channel 1 Alarm 2 |
| ALM3.1 | Channel 1 Alarm 3 |
| ALM4.1 | Channel 1 Alarm 4 |
| SERR.1 | Channel 1 Input Error |
| RSER.1 | Channel 1 Remote SP Error |
| IRUN.1 | Channel 1 Run |
| SGN.1 | Channel 1 Segment No. Output |
| SEG.1 | Channel 1 Segment Output/ |
|  | Time Signal |
| PEND.1 | Channel 1 Program End |

Models with more than one input have the same setting data for channels 2 to 4 , depending on the number of input points.

## Main Functions

## - Inputs

## - Event Input Assignments

First, set the input type switch for each input to specify using either a temperature input (thermocouple (TC) or resistance thermometer (PT)) or an analog input (current input or voltage input), and then set the Input Type parameter.

If the input type switch is set to a temperature input (resistance thermometer or thermocouple), the temperature unit can be set. If the input type switch is set to an analog input (current input or voltage input), scaling and the decimal point position can be set.

Location of Input Type Switches

An operation command can be assigned to each event input. If event inputs are to be used, use an E5AR/ER- $\square \square B / D / M$ Controller.

For models with more than one input, assignments can be made for channels 2 and higher as needed depending on the number of channels. The Communications Writing OFF/ON operation instruction is common to all channels.

The type of control performed by each Controller is selected by setting the control mode. Setting the control mode sets default values for the output assignments required for the control.
After setting the control mode, specify direct/reverse operation for each channel.

## Standard Models

The control modes that can be selected depend on the number of input points.

| Control mode | 1-input models | 2-input models | 4-input models | Outputs | Control/Transfer output assignment |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Standard Control | IN1 | IN1 | IN1 | OUT1 | Channel 1 Control Output (Heating) |
|  |  | IN2 | IN2 | OUT2 | Channel 2 Control Output (Heating) |
|  |  |  | IN3 | OUT3 | Channel 3 Control Output (Heating) |
|  |  |  | IN4 | OUT4 | Channel 4 Control Output (Heating) |
| Heating/Cooling Control | IN1 | IN1 | IN1 | OUT1 | Channel 1 Control Output (Heating) |
|  |  |  |  | OUT2 | Channel 1 Control Output (Cooling) |
|  |  | IN2 | IN2 | OUT3 | Channel 2 Control Output (Heating) |
|  |  |  |  | OUT4 | Channel 2 Control Output (Cooling) |
| Standard Control with Remote SP | - | IN1 <br> IN2: Remote SP | - | OUT1 | Channel 1 Control Output (Heating) |
| Heating/Cooling Control with Remote SP | - | $\begin{aligned} & \text { IN1 } \\ & \text { IN2: Remote SP } \end{aligned}$ | - | OUT1 <br> OUT2 | Channel 1 Control Output (Heating) Channel 1 Control Output (Cooling) |
| Proportional Control | - | IN1 <br> IN2: Ratio setting | - | OUT1 | Channel 1 Control Output (Heating) |
| Cascade Standard Control | - | IN1: Primary loop IN2: Secondary loop | - | OUT1 | Channel 2 Control Output (Heating) |
| Cascade Heating/ Cooling Control | - | IN1: Primary loop IN2: Secondary loop | - | $\begin{aligned} & \text { OUT1 } \\ & \text { OUT2 } \end{aligned}$ | Channel 2 Control Output (Heating) Channel 2 Control Output (Cooling) |
|  |  | Direct/Reverse operation |  |  | Description |
|  |  | Direct operation (cooling) | Control whereby the MV is increased as the present value increases (When the present value (PV) is higher than the set point (SP), the MV is increased in proportion to the difference between the PV and the SP.) |  |  |
|  |  | Reverse operation (heating) | Control whereby the MV is decreased as the present value increases (When the present value (PV) is lower than the set point (SP), the MV is increased in proportion to the difference between the PV and the SP.) |  |  |

- When pulse outputs are used, the control period must be set for each channel.
Note: "Pulse outputs" indicates relay outputs and voltage outputs (for driving SSRs).

## Position-proportional Control Models

Position-proportional Control Models support only standard control.

| Control mode | 1-input models | 2-input models | 4-input models | Outputs | Control/Transfer output assignment |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Standard Control | IN1 | - | - | OUT1 | Channel 1 Control Output (Open) |
|  |  |  |  | OUT2 | Channel 2 Control Output (Closed) |
|  |  | Direct/Reverse operation |  |  | Description |
|  |  | Direct operation (cooling) |  | Control whereby the MV is increased as the present value increases <br> (When the present value (PV) is higher than the set point (SP), the MV is increased in proportion to the difference between the PV and the SP.) |  |
|  |  | Reverse operation (heating) |  | Control whereby the MV is decreased as the present value increases <br> (When the present value (PV) is lower than the set point (SP), the MV is increased in proportion to the difference between the PV and the SP.) |  |

- Floating control or closed control can also be selected for the Position-proportional Control Models. Floating control enables position-proportional control without a feedback potentiometer.
- Control/Transfer

Output
Assignments

Parameters can be used to assign the type of data that is output from each output. For the models with more than one input, assignments can be made for channels 2 and higher as needed depending on the number of channels.

| Outputs | Control/Transfer Output Assignments $\quad$ Channel 1 |
| :---: | :---: |
| OUT1 | Channel 1 control output (heating or open) for control output |
| OUT2 | Channel 1 control output (cooling or close) for control output |
| OUT3 | Channel 1 present set point |
| OUT4 | Channel 1 PV |
|  | Channel 1 control output (heating or open) for transfer output |
|  | Channel 1 control output (cooling or close) for transfer output |
|  | Channel 1 valve opening |

When control outputs are used, assignments are made automatically based on the control mode that is set, as explained on the previous page. No changes are necessary.
When an output is used as a transfer output, assign the data to be transferred to an unused output.

For outputs with multi-output functionality, specify a voltage output (for driving SSR) or a linear current output using the multi-output output type setting.

For linear current outputs, 0 to 20 mA or 4 to 20 mA can be selected. Voltage outputs (for driving SSRs) are 12 VDC, 40 mA .
Outputs

| OUT1 | Multi-output output type | Linear curren |
| :---: | :---: | :---: |
| OUT2 | Voltage output (for driving SSR) | 0 to curren |
| OUT3 | Linear Current Output | 0 to 20 mA |
| OUT4 |  | 4 to 20 mA |

## Auxiliary Output Assignments

The type of data that is output from each auxiliary output can be assigned.

For models with more than one input, assignments can be made for channels 2 and higher as needed depending on the number of channels.

The U-ALM output is an OR output of alarm functions 1 to 4 for all channels.

All Channels
Alarm 1 OR output of all channels Alarm 2 OR output of all channels Alarm 3 OR output of all channels Alarm 4 OR output of all channels Input Error OR output of all channels RSP Input Error OR output of all channels U-ALM Output

## Model Number Structure

E5AR-T

## E5ER-T

## - Installation Procedure

(1) If the front of the Controller needs to be watertight, attach the enclosed watertight packing.
If the front of the Controller does not need to be watertight, the watertight packing does not need to be attached.
(2) Insert the Controller into the cutout in the panel.
(3) Insert the enclosed fittings into the grooves on the top and bottom of the rear case.

## E5AR-T

E5ER-T

(4)

- Pulling Out the Controller

Normally there is no need to pull out the Controller. However, it can be pulled out if needed for maintenance purposes.

When pulling out the Controller, place a cloth over the screwdriver to prevent scratches and other damage.

### 2.2 Using the Terminals

Verify the layout of the terminals (labeled beginning from A and from 1) using the markings on the top and sides of the case.

## Precautions when Wiring

- To avoid the effects of noise, wire the signal wires and the power line separately.
- Use crimp terminals to connect to the terminals.
- Tighten screws to a torque of 0.40 to $0.56 \mathrm{~N} \cdot \mathrm{~m}$.
- Use M3 crimp terminals with one of the shapes shown at the left.

## $\square$ Wiring

## Power Supply (Terminals)

- Inputs (Terminals)

E5ER-T

|  | A |  | B |  |

| 6 |  |  |  | 6 |
|  | C | D | E |  |

The area inside the lines around terminal numbers in the diagram represents the interior of the Controller, and the area outside the lines represent the exterior.

- Connect terminals A1 and A2 as follows:

The input power supply depends on the model.
100 to 240 VAC or 24 VAC/VDC (no polarity)

| Input voltage | E5AR-T | E5ER-T |
| :--- | :---: | :---: |
| 100 to $240 \mathrm{VAC}, 50 / 60 ~ \mathrm{~Hz}$ <br> 100 to $120 \mathrm{VAC}, 50 / 60 \mathrm{~Hz}$ (for UL certification) <br> 100 to $240 \mathrm{VAC}, 50 / 60 \mathrm{~Hz}$ (for CE marking) | 22 VA | 17 VA |
| $24 \mathrm{VAC}, 50 / 60 \mathrm{~Hz}$ | 15 VA | 11 VA |
| 24 VDC (no polarity) | 10 W | 7 W |

- For input 1 (IN1), connect terminals K4 to K6 on the E5AR-T, or E4 to E6 on the E5ER-T according to the input type, as shown below.
- For a Controller with more than one input, connect inputs 2 to 4 (IN2 to IN4) in the same way according to the number of input points.
E5AR-T

E5ER-T

To prevent the appearance of error displays due to unused inputs, set the Number of Enabled Channels parameter.

## - Control/Transfer

Outputs
(Terminals)
E5AR-T

E5ER-T

- On the E5AR-T, control output 1 (OUT1) outputs to terminals F5 and F6, and control output 2 (OUT2) outputs to terminals F3 and F4.
- On the E5ER-T, control output 1 (OUT1) outputs to terminals C5 and C6, and control output 2 (OUT2) outputs to terminals C3 and C4.
- On a Controller with more than one input, output takes place from control output 3 (OUT3) and control output 4 (OUT4).

E5AR-T

E5ER-T

- If terminals 5 and 6 are used for a voltage output (for driving SSR), approximately 2 V are output when the power is turned ON (load resistance: $10 \mathrm{k} \Omega$ max. for 10 ms ).
- If a linear current output is used, approximately 2 mA are output for 1 second when the power is turned ON.
- Control outputs that are not used for control can be used for transfer outputs by setting the Control/Transfer Output Assignment parameters.
- Specifications for each output type are as follows:

| Output type | Specifications |
| :---: | :--- |
| Voltage Output <br> (for driving SSR) | Output voltage: $12 \mathrm{VDC+}+15 \%,-20 \%(\mathrm{PNP}$ ) <br> Max. load current: $40 \mathrm{~mA}^{*}$, with short-circuit pro- <br> tection circuit |
| Linear Current <br> Output | 0 to 20 mA DC (resolution: approx. 54,000) <br> 4 to 20 mA DC <br> Load: $500 \Omega$ (resolution: approx. 43,000) |

* The value for the E5AR-TQQ $\square \square \square \mathrm{WW}-\square \square \square$ is 21 mA max.
- A Position-proportional Control Model has relay outputs (250 VAC, 1 A). Control output 1 (OUT1) is an open output and control output 2 (OUT2) is a closed output.

- Relay output specifications are as follows: 250 VAC, 1 A (including inrush current)
- On the E5AR-T $\square 4 \square \square$, auxiliary outputs 1 to 4 (SUB1 to SUB4) output to terminals B1 to B6.

- Relay output specifications are as follows: 250 VAC, 1 A (including inrush current)
- On the E5AR-T $\square E \square \square$, auxiliary outputs 1 to 5 (SUB1 to SUB5) output to terminals B1 to B6, and auxiliary outputs 6 to 10 (SUB6 to SUB10) output to terminals C1 to C6.

E5AR-T $\square$ E $\square$

- Transistor output specifications are as follows:

Maximum load voltage: 30 VDC
Maximum load current: 50 mA
Residual voltage: 1.5 V max.
Leakage current: 0.4 mA max.

- On the E5ER-T $\square 4 \square \square$, auxiliary outputs 1 to 4 (SUB1 to SUB4) output to terminals B1 to B6.

- Relay output specifications are as follows:

250 VAC 1 A

- On the E5ER-T $\square \square \square$ auxiliary outputs 1 and 2 (SUB1 and SUB2) output to terminals D3 to D6.

- Transistor output specifications are as follows:

Maximum load voltage: 30 VDC
Maximum load current: 50 mA
Residual voltage: 1.5 V max.
Leakage current: 0.4 mA max.

- To use a Position-proportional Control Model to monitor the amount of valve opening or perform closed control, connect a potentiometer (PMTR) as shown in the following diagram.

- For information on the potentiometer, refer to the manual for the valve you are connecting. Terminal numbers are as follows:
O: Open, W: Wipe, C: Close
The input range is $100 \Omega$ to $2.5 \mathrm{k} \Omega$ (between C and O ).
- To use event inputs on the E5AR-T, connect event inputs 1 and 2 (EV1 and EV2) to terminals K1 to K3, event inputs 3 to 6 (EV3 to EV6) to terminals numbers E2 to E6 event inputs 7 to 10 (EV7 to EV10) to terminals numbers D2 to D6. The number of event inputs depends on the model.
- To use event inputs on the E5ER-T, connect event inputs 1 and 2 (EV1 and EV2) to terminals E1 to E3 and event inputs 3 to 6 (EV3 to EV6) to terminals numbers B2 to B6. The number of event input points depends on the model.
- The number of input points for each model is as follows:

E5AR-T $\square \square \square B$, E5ER-T $\square \square \square$ B: 2 points, EV1 and EV2
E5AR-T $\square \square D \square$, E5ER-T $\square \square D: 4$ points, EV3 to EV6
E5AR-T $\square \square M \square$ : 8 points, EV3 to EV10
E5AR-T $\square \square$ MB: 10 points, EV1 to EV10
E5AR-T

E5ER-T

- The input ratings of each input are as follows:

| Contact | ON: $1 \mathrm{k} \Omega$ max., OFF: $100 \mathrm{k} \Omega$ or higher |
| :--- | :--- |
| Non-contact | ON: residual voltage of 1.5 V max., <br> OFF: leakage current of 0.1 mA max. |

- To communicate with a host system, connect the communications line between terminals F1 and F2 on the E5AR-T, or between C1 and C 2 on the E5ER-T.

- The connection type is $1: 1$ or $1: \mathrm{N}$. With a $1: \mathrm{N}$ installation, up to 32 Controllers, including the host computer, can be connected.
- The maximum total cable length is 500 m .
- Use a shielded twisted-pair cable (AWG28 min.).

Cable Reference Diagram

- Use a resistance of 100 to $125 \Omega(1 / 2 \mathrm{~W})$ for the terminators. Install terminators at both ends of the transmission path, including the host computer.
- To connect to an RS-232C port on a computer, use an RS-232C-485 converter.
Example converter: K3SC RS-232C/RS-485 Interface Converter

Insulation Blocks As shown in the following diagram, the function blocks of the E5AR-T/ ER-T are electrically insulated.
Functional insulation is provided between all of the following: <Inputs>, <event inputs/voltage outputs/current outputs>, and <communications>.

Basic insulation is provided between all of the following: <Inputs/event inputs/voltage outputs/current outputs/communications>, <relay outputs>, and <transistor outputs>.
If reinforced insulation is required, input, event input, voltage output, current output, and communications terminals must be connected to a device that have no exposed charged parts and whose basic insulation is suitable for the applicable maximum voltage of connected devices.

| Power supply | Input 1/potentiometer input <br> Input 2 <br> Input 3 <br> Input 4 <br> Event inputs, voltage outputs, current outputs <br> Communications |

## Section 3 Typical Control Examples

3.1 Standard Control ..... 3-2
3.2 Coordinated Electric Oven Operation ..... 3-7

### 3.1 Standard Control

This section introduces an example of program control of an electric oven as a basic control example.

## Application

$\begin{array}{ll}\text { - Connection } & \text { The following connections are used to control an electric oven using } \\ \text { Configuration } & \text { the E5AR-T. Here, the E5AR-TQ4B is used. }\end{array}$ Configuration

- Programmed

Operation Example

## Wiring

A type-R thermocouple is connected to the IN1 terminal, and an SSR is connected to the OUT1 terminal. The wiring for the E5AR-TQ4B is shown in the following diagram.

E5AR-T

## Settings

Set the parameters as follows:

| Parameter | Setting |
| :--- | :--- |
| Input 1 type switch | TC. PT (default ) |
| Input 1 Input Type | 11 (R 0.0 to $\left.1700.0^{\circ} \mathrm{C}\right)$ |
| Output 1 Type | 0 (Voltage Output (for driving SSR) <br> (default)) |
| Control Mode | 0 (Standard Control (default)) |
| Direct/Reverse Operation | ar -r (Reverse Operation (default)) |
| PV Start | 5 (SP Start (default)) |
| End Condition | Cant (Continue (default)) |
| Control Period (Heating) | 2.0 |

## - Setting Procedure

Input Initial Setting Level

1. Before turning ON the power, be sure that the input 1 type switch is set to TC. PT.
2. Turn ON the power and then hold down theKey for at least 3 seconds to move from the Operation Level to the Input Initial Setting Level. $=:-t$ (Input 1 Input Type) will be displayed. Press the 스 Key to select the setting 11 (R 0.0 to $1700.0^{\circ} \mathrm{C}$ ).

## Control Initial Setting Level

Control Mode
sejduexe
[0n!u09 leojd
3. Press the $\square$ Key for less than 1 second to move from the Input Initial Setting Level to the Control Initial Setting Level. $\bar{a} i-\xi$ (Output 1 Type) will be displayed. Make sure that the set value is 0 (Voltage Output (for driving SSR)).
4. Press the Key repeatedly to select node (Control Mode). Make sure that the setting is 0 (Standard Control).
5. Press the Key to select $\operatorname{ar}_{\boldsymbol{a}} \mathrm{E}_{\boldsymbol{\mu}}$ (Direct/Reverse Operation). Make sure that the setting is ar-r (Reverse Operation).
6. Press the Key repeatedly to select Pust (PV Start). Make sure that the setting is $5^{9}$ (SP Start).
7. Press the $\square$ Key for less than 1 second to move from the Control Initial Setting Level to the Input Initial Setting Level and then press the Key
 the Key and set the password to -169 to move to Advanced Function Setting Level.
8. Press the $\square$ Key or less than 1 second to move from the Advanced Function Setting Level to the Expansion Control Setting Level.
9. Press the Key to select E5Et (End Condition). Press the 因 Key to select the setting Iant (Continue).
10. Press the $\square$ Key twice for at least 1 second to return to the Operation Level, and then press the $\square$ Key for less than 1 second to move from the Operation Level to the Adjustment Level.
11. Press the Key repeatedly to select [P (Control Period (Heating)), and then press the $\otimes$ Key to select 2.5 .

## ■ Program Settings

The following program is used in this example.

## - Setting Procedure

1. Press the $\square$ Key for less than 1 second to move to the Program Setting Level. Pr-i.n (Program Editing) will be displayed. Set the program number to 1 .
2. Press the Key to select $5-n \bar{a}$ (Number of Segments Used). Press the $\approx$ Key to select 6 segments.
3. Press the Key to select $5 E[$ (Segment Editing). Change from End to t.
4. Press the Key to select $5 \boldsymbol{P}$ (Segment Set Point). Press the 圆 Key to set the set point to 200.5
 the time to 160

Typical Control
Examples

5 Segment

Senment Editing
7. Press the Key to return to $5 E[$ n (Segment Editing). The segment

## Adjustment

number will automatically change to $?$.
8. Press the Key to select $5^{9}$ (Segment Set Point). Press the 园 Key to set the set point to 900.0 .
9. Press the Key to select $\operatorname{GinE}$ (Segment Time). Press the 图 Key to set the time to $: 30$.

11. Press the Key to return to $5 \mathbb{E}$ (Segment Editing). The segment number will automatically change to 3 .

Note: Continue repeating the above procedure to set segments 3 to 6 . When finished, press the $\qquad$ Key for less than 1 second to move to the Operation Level.
to Ule Uperaioni Levei.

To adjust the PID constants, execute autotuning.
For more information, see 4.10 Determining the PID Constants (AT or Manual Settings) (P. 4-33).

### 3.2 Coordinated Electric Oven Operation

With Models with Four Input Channels, coordinated operation can be performed based on channel 1. Operation is programmed using the same program for all channels. Offsets can be set for channels 2 to 4.

## ■ Application

Traditionally, three programmable temperature Controllers were required to control electric ovens in three zones. With the E5AR-T/ERT , however, only one Controller is required for coordinated operation as long as the same program is used. Here, the E5AR-TCCE3MWW-FLK is used.

## Wiring

## Settings

Inputs 1, 2 and 3 are set for type-K thermocouples. The settings for input 1 are shown below. The same settings are used for inputs 2 and 3.

| Type | Setting |
| :--- | :--- |
| Input 1 type switch <br> (Same for inputs 2 and 3.) | TC. PT (factory setting) |
| Input 1 Input Type parameter <br> (Same for inputs 2 and 3.) | $2: \mathrm{K},-200.0$ to $1300^{\circ} \mathrm{C}$ (default) |
| Number of Enabled Channels parameter | 3 |

- Setting Procedure

1. Hold down theKey for at least 3 seconds to move from the Operation Level to the Input Initial Setting Level. $=:-t$ (Input 1 Input Type) will be displayed. Press the 图 Key to select the setting 2 ( $\mathrm{K}-200.0$ to $1300.0^{\circ} \mathrm{C}$ )
2. Press the Key repeated to select $\operatorname{Rn}$ (Move to Advanced Function Setting Level). Press the $\approx$ Key and set the password to -169 to move to Advanced Function Setting Level.
3. Press the Key repeated to select $[\mathrm{H}-\mathrm{n}$ (Number of enabled channels). Press the Key to set the number of enabled channels to 3 . This will disable channel 4.
4. Press theKey twice for at least 1 second to return to the Input Initial Setting Level, and then press theKey for at least 1 second to return to the Operation Level.

Input the program for channel 1 according to the setting procedure in 3.1 Standard Control (P. 3-2).

4.14 Changing Channels ..... 4-50
4.15 Adjusting Programs ..... 4-51
4.16 Operating Precautions ..... 4-52

### 4.1 Setting Levels and Key Operations

The parameters are grouped into levels and the values that are set for the parameters are called set values. On the E5AR-T/ER-T, the parameters are grouped into 19 levels as shown below.
When the power is turned ON, all indicators will light for 1 second. The initial level after turning ON the power is the Operation Level.

Power ON

| Level | Description | Operation |
| :---: | :---: | :---: |
| Protect Level | Settings to prevent accidental key inputs. | During operation |
| Operation Level | Basic displays and settings for operation. |  |
| Program Setting Level | Program and segment settings. |  |
| Adjustment Level | Option settings and control adjustments. |  |
| Adjustment 2 Level | Settings that can be adjusted during processing function control operations. |  |
| Alarm Set Setting Level | Settings for each alarm set. |  |
| PID Setting Level | PID constants and limit settings for each PID set. |  |
| Time Signal Setting Level | Settings for time signals. |  |
| Approximation Setting Level | Broken-line approximation and straight-line approximation settings. |  |
| Monitor Item Level | Monitor displays for set values. |  |
| Input Initial Setting Level | Initial settings related to inputs. | When operation is stopped |
| Control Initial Setting Level | Initial settings for output types and control modes. |  |
| Control Initial Setting 2 Level | Initial settings for processing functions. |  |
| Alarm Setting Level | Alarm type and output settings. |  |
| Display Adjustment Level | Display adjustment settings. |  |
| Communications Setting Level | Communications speed, communications data length, and other communications settings. |  |
| Advanced Function Setting Level | Initialization of settings and PF Key settings. |  |
| Expansion Control Setting Level | Advanced control settings and position-proportional control settings. |  |
| Calibration Level | Calibration by the user. |  |

* To move to the Advanced Function Setting Level, set the Initial Setting Protection parameter in the Protect Level to 0 .

## Changing Parameters

Within each level, the parameter will change either forward or backward each time the Key is pressed. (The parameters will not change backward in the Calibration Level.) For details, refer to Section 8 Parameters.

## Saving Parameter Settings

- The first parameter will be displayed if the Key is pressed when the last parameter is being displayed.
- To change a setting, use the and $\triangleq$ Keys to change the setting and then either wait for 2 seconds or press the Key to save the change.
- A change to a parameter setting is also saved when the level is changed.
- Before turning OFF the power supply, always be sure that any changes to parameter settings are confirmed (e.g., by pressing the Tey). Any changes made with the and $\triangle$ Keys that have not been saved will be lost when the power supply is turned OFF.

Control is stopped in following levels: Input Initial Settings, Control Initial Setting, Control Initial Settings 2, Alarm Settings, Display Adjustment, Communications Settings, Advanced Function Settings, Expansion Control Settings and Calibration. Control will stop on all channels as soon as you move to any of these levels.
Display No. 3 shows the current level. The characters and the corresponding levels are as follows:

| $\square$ | Display No. 3 | Level |
| :---: | :---: | :---: |
|  | L.Pre | Protect Level |
|  | Not lit *1 | Operation Level |
|  | Not lit *1 | Program Setting Level |
|  | L.Rdこ | Adjustment Level |
|  | L.Rde | Adjustment 2 Level |
|  | 2.96- | Alarm Set Setting Level |
|  | LPd | PID Setting Level |
|  | Not lit *2 | Time Signal Setting Level |
|  | LEEE | Approximation Setting Level |
|  | L.non | Monitor Item Level |
|  | 1.0 | Input Initial Setting Level |
|  | 1.1 | Control Initial Setting Level |
|  | 1.3 | Control Initial Setting 2 Level |
|  | 1.3 | Alarm Setting Level |
|  | 1.4 | Display Adjustment Level |
|  | 1.5 | Communications Setting Level |
|  | L.RdF | Advanced Function Setting Level |
|  | LEuT | Expansion Control Setting Level |
|  | L. [P1 | Calibration Level |
|  | The progra The progra | number and segment number are displayed. number and $t 5$ are displayed. |

### 4.2 Set Values

The value selected for each parameter is called the set value. There are two types of set values: numbers and characters. Set values are displayed and changed as follows:

## Changing a Numeric Set Value

1. Press the 人 Key continuously to increase the set value.

When the upper limit of the setting is reached, the set value will flash and cannot be increased any further.
2. Press the $\approx$ Key continuously to decrease the set value.

When the lower limit of the setting is reached, the set value will flash and cannot be decreased any further.
3. Follow steps 1 and 2 to change the set value to the desired value.

The setting is saved 2 seconds after it is changed, or when a key other than the or Key is pressed.

When setting the Manual MV parameter, the set value is output every 50 ms . The set value is saved as described above.

### 4.3 Initial Setting Example

This section describes how to make the initial settings for the sensor input type, alarm type, control period, and other parameters. Use the $\square$ Key and Key to move through the displays. The parameter that is displayed next depends on how long the key is held down.

- Interpreting the Example

## - Typical Example

### 4.4 Setting the Input Type

Set the input type switch and the Input Type parameter according to the sensor to be used. Check the table below and set the correct value for the sensor temperature range to be used.
When using a Controller with more than one input, also set input type switches 2 to 4 and the Input 2 to 4 Type parameters according to the number of input points.

## - Input Type

Setting Input 1 to a Platinum Resistance Thermometer Pt100, -150.0 to $150.0^{\circ} \mathrm{C}$ ( -199.99 to $300.00^{\circ} \mathrm{F}$ )

1. Make sure that the input 1 type switch is set to TC.PT and then turn ON the power.
2. Hold down the $\square$ Key for at least 3 seconds to move from the Operation Level to the Input Initial Setting Level. The display will show $=:-t$ (Input 1 Type).

3. Press the $\approx$ Key to enter the set value for the desired sensor.

When using a Pt100 platinum resistance thermometer ( -150.00 to $150.00^{\circ} \mathrm{C}\left(-199.99\right.$ to $\left.300.00^{\circ} \mathrm{F}\right)$ ), set the value to 1 .

## Input Types

| Set value | Input type | Setting range |  | Input type switch |
| :---: | :---: | :---: | :---: | :---: |
|  |  | $\left({ }^{\circ} \mathrm{C}\right)$ | $\left({ }^{\circ} \mathrm{F}\right)$ |  |
| 0 | Pt100 (1) | -200.0 to 850.0 | -300.0 to 1500.0 | TC.PT |
| 1 | Pt100 (2) | -150.00 to 150.00 | -199.99 to 300.00 |  |
| 2 | K (1) | -200.0 to 1300.0 | -300.0 to 2300.0 |  |
| 3 | K (2) | -20.0 to 500.0 | 0.0 to 900.0 |  |
| 4 | $J$ (1) | -100.0 to 850.0 | -100.0 to 1500.0 |  |
| 5 | $J$ (2) | -20.0 to 400.0 | 0.0 to 750.0 |  |
| 6 | T | -200.0 to 400.0 | -300.0 to 700.0 |  |
| 7 | E | 0.0 to 600.0 | 0.0 to 1100.0 |  |
| 8 | L | -100.0 to 850.0 | -100.0 to 1500.0 |  |
| 9 | U | -200.0 to 400.0 | -300.0 to 700.0 |  |
| 10 | N | -200.0 to 1300.0 | -300.0 to 2300.0 |  |
| 11 | R | 0.0 to 1700.0 | 0.0 to 3000.0 |  |
| 12 | S | 0.0 to 1700.0 | 0.0 to 3000.0 |  |
| 13 | B | 100.0 to 1800.0 | 300.0 to 3200.0 |  |
| 14 | W | 0.0 to 2300.0 | 0.0 to 4100.0 |  |

| S |  |  |  | Input type switch |
| :---: | :---: | :---: | :---: | :---: |
| S | Input type | $\left({ }^{\circ} \mathrm{C}\right)$ | （ ${ }^{\circ} \mathrm{F}$ ） |  |
| 15 | 4 to 20 mA | One of the following ranges is displayed depending on the scaling．$\begin{gathered} -19999 \text { to } 99999 \\ -1999.9 \text { to } 9999.9 \\ -199.99 \text { to } 999.99 \\ -19.999 \text { to } 99.999 \\ -1.9999 \text { to } 9.9999 \end{gathered}$ |  | ANALOG |
| 16 | 0 to 20 mA |  |  | TC．PT |
| 17 | 1 to 5 V |  |  | 企 |
| 18 | 0 to 5 V |  |  |  |
| 19 | 0 to 10 V |  |  | ANALOG |

[^1]
## Hint

When an analog input（voltage or current input）is used， scaling is possible according to the type of control．

## Scaling

$\square$ 20 10

Setting the Display to Show 0.0 for an Input Value of 5 mA and 100.0
 for 20 mA When the Input 1 Type Parameter Is Set to 4 to 20 mA ．

1．Hold down the $\square$ Key for at least 3 seconds to move from the Operation Level to the Input Initial Setting Level．

2．Make sure that： $\mathbf{- 1} \boldsymbol{E}$（Input 1 Type）is set to 15 （ 4 to 20 mA ）．

3．Press the Key repeatedly to select in． 4 （Scaling Input Value 1）． Set the scaling input value to 5 with the 人 and $\mathbb{V}$ Keys．
 Set the scaling display value to 0 with the and $\triangle$ Keys．

5．Press the Key to select 5 （Scaling Input Value 2）． Set the scaling input value to 20 with the and Keys．

6．Press the $\sigma$ Key to select $d 5 \cdot ?$（Scaling Display Value 2）． Set the scaling display value to 1000 with the 图 and Keys．

7. Press the Key to select $\mathbb{d P}^{\prime}$ (Decimal Point Position).

Set the decimal point position to 1 with the 因 and Keys.
8. Hold down the $\square$ Key for at least 1 second to return to the Operation Level.

Scaling can be set separately for each channel. For scaling, inputs 1 to 4 of a Controller with more than one input correspond to channels 1 to 4. Select the channel with the CH Key and then set the scaling.

## Scaling Parameters

| Parameter | Attribute | Display | Setting range | Default setting | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Scaling Input Value 1 | CH | EnP. 1 | See table below. | 4 | See table below. |
| Scaling Display Value 1 | CH | d59. 1 | -19999 to scaling display value $2-1$ | 0 | EU |
| Scaling Input Value 2 | CH | InPe | See table below. | 20 | See table below. |
| Scaling Display Value 2 | CH | d5P. ${ }^{3}$ | Scaling display value $1+1$ to 99999 | 100 | EU |
| Decimal Point Position | CH | $d^{P}$ | 0 to 4 | 0 | - |

## Setting Range and Unit for Each Input Type

| Input type | Setting range | Unit |
| :---: | :---: | :---: |
| 4 to 20 mA | 4 to 20 | mA |
| 0 to 20 mA | 0 to 20 | mA |
| 1 to 5 V | 1 to 5 | V |
| 0 to 5 V | 0 to 5 | V |
| 0 to 10 V | 0 to 10 | V |

The operation of E5AR-T/ER-T control functions and alarms is based on the input value. If a value greater than in? (Scaling Input Value 2) is set for ind (Scaling Input Value 1), operation will be as follows for the display value:

- Direct/Reverse Operation

When direct operation is set, the manipulated variable will increase when the display value decreases. When reverse operation is set, the manipulated variable will increase when the display value increases.

For information on direct and reverse operation, refer to 4.7 Setting Output Parameters (P. 4-20).

- Alarms

The upper-limit alarm and lower-limit alarm will be inverted. Therefore, set an alarm type and alarm values that invert the upper limit or lower limit of the display value. For example, if an absolute-value upper limit is set for the alarm type, operation will be as shown in the following figure.

For information on alarms, refer to 4.11 Using Auxiliary Outputs (P. 4-37).

- Input Correction

The sign of the input correction value will be inverted. Therefore, set the Input Correction 1 and Input Correction 2 parameters to values that invert the sign of the display value. For more information on input correction, refer to 5.1 Input Adjustment Functions (P. 5-2).

- PID Set Automatic Selection

If the PID Set Automatic Selection Data parameter is set to "PV," set the PID Set Automatic Selection Range Upper Limit parameter so that the set value decreases for the PID set numbers in ascending order as shown in the following figure.

If the PID Set Automatic Selection Data parameter is set to "DV," the DV used when performing autoselect will be inverted.
For more information on the PID Set Automatic Selection parameter, refer to 5.2 Control Functions (P. 58).

### 4.5 Selecting the Temperature Unit

When the input type is set to a temperature input (input from a thermocouple or a platinum resistance thermometer), either ${ }^{\circ} \mathrm{C}$ or ${ }^{\circ} \mathrm{F}$ can be selected for the temperature unit.
When using a Controller with more than one input, set the temperature unit separately for each input (inputs 2 to 4) according to the number of inputs.

Selecting ${ }^{\circ} \mathrm{C}$

1. Hold the $\square$ Key down for at least 3 seconds to move from the Operation Level to the Input Initial Setting Level.

2. Press the Key to select I idt $^{\text {it }}$ (Input 1 Temperature Units)

Select ${ }^{\circ} \mathrm{C}$ or ${ }^{\circ} \mathrm{F}$ with the 图 and Keys.
[: ${ }^{\circ} \mathrm{C} \quad F:{ }^{\circ} \mathrm{F}$
3. Hold the $\square$ Key down for at least 1 second to return to the Operation Level.

### 4.6 Selecting the Control Mode

The control mode allows various types of control to be performed. The control mode is set to standard control by default.

## Standard Control

- Standard heating or cooling control is performed. The Direct/ Reverse Operation parameter is used to select heating (reverse operation) or cooling (direct operation).
- When using PID control, the Proportional Band (P), Integral Time (I), and Derivative Time (D) parameters must be set.
These PID constants can be set either using auto-tuning (AT) or manually.
- When the proportional band $(\mathrm{P})$ is set to $0.00 \%$, control becomes ON/OFF control.

## Heating/Cooling Control

- Heating and cooling control is performed.
- When using PID control, in addition to the Proportional Band (P), Integral Time (I), and Derivative Time (D) parameters, the Cooling Coefficient and Dead Band parameters must also be set.
The PID constants can be set either using auto-tuning (AT) or manually. The Cooling Coefficient and Dead Band parameters must be set manually.
- When the proportional band $(\mathrm{P})$ is set to $0.00 \%$, control becomes ON/OFF control and 3-position control is possible.
- Dead Band

The dead band is set centered on the set point. The dead band width is set in the Dead Band parameter in the Adjustment Level. A negative setting sets an overlap band.

- The default dead band is 0.00 .

If heating and cooling characteristics of the controlled object are different and good control characteristics cannot be achieved with the same PID constants, a cooling coefficient can be set to adjust the proportional band for the cooling control output to achieve balance between heating and cooling control.

Heating $P=P$
Cooling $\mathrm{P}=$ Heating $\mathrm{P} \times$ Cooling coefficient
The cooling P is obtained by multiplying the heating P by the cooling coefficient to control the cooling output with different characteristics from the heating output.

The following control modes can be selected only on Controllers with 2 inputs.

Standard Control with Remote SP

- An external DC current or voltage signal can be input into the remote SP input (input 2) to perform standard control using the remote SP input as the SP.
- Input 2 can be used within the setting range determined by the input 2 type.

## ■ Heating/Cooling Control with Remote SP

- An external DC current or voltage signal can be input into the remote SP input (input 2) to perform heating/cooling control using the remote SP input as the SP.
- Input 2 can be used within the setting range determined by the setting of the Input 2 Type parameter.

## - Proportional Control

- Proportional control is used to maintain a set proportional relationship between two variables.
- Proportional control is set in the Analog Parameter 1 (control rate) parameter.
- If the input type set for input 1 and input 2 are different, the units for input 1 and input 2 must be adjusted. Settings must be made for the following: first, the Straight-line Approximation 1 parameters must be
 used to convert input 2 from normalized data to industrial units and then the Straight-line Approximation 2 parameters must be used to convert the industrial units back to normalized data for input 1.

## Hint

Set all numeric values for straight-line or broken-line approximation for the E5AR-T/ER-T to normalized data. For example, set 0.0200 for $20 \%$. Also, when input 1 is set to a K-type thermocouple from 200.0 to 1300.00, $200.0^{\circ} \mathrm{C}$ is $0 \%$, or 0.000 , and $1300^{\circ} \mathrm{C}$ is $100 \%$, or 1.000 .

## Cascade Standard Control

- Cascade control can be performed using standard control (heating control or cooling control).
- Input 1 is for the primary loop (channel 1 ) and input 2 is for the secondary loop (channel 2).
- AT with Cascade Control

(1) Execute AT for the secondary side to find the suitable PID constants.
Set the PV on the secondary side during stable control near the primary side SP as the fixed SP for the secondary side.
Set the channel 2 SP mode to Fixed SP Mode (cascade open), set the secondary side to independent control and execute AT.
Once AT has been completed, find the secondary side PID constants.
(2) Change to cascade control and execute AT for the primary side to find the suitable PID constants.
Change the channel 2 SP mode to Remote SP Mode (cascade closed), change to cascade control, and execute AT for channel 1.

## Cascade Heating/Cooling Control

- Cascade control can be performed using heating/cooling control.
- Input 1 is for the primary loop (channel 1) and input 2 is for the secondary loop (channel 2).

The Control Mode parameter does not need to be set for Position-proportional Control Models. These models always perform position-proportional control.

## Position-proportional Control

- A potentiometer is used to determine how much the valve is open or closed. The opening of valves with control motors attached can be controlled, i.e., opened or closed.
- With position-proportional control, control can be switched between closed control and floating control. Travel time can be automatically measured using motor calibration, and position-proportional dead band, open/close hysteresis, PV dead band, and other parameters can be set.
- Closed Control

When a potentiometer is connected, closed control provides feedback on the valve opening.

- Floating Control

No feedback is provided on the valve opening using a potentiometer. Control is possible without a potentiometer connected.

## - Motor Calibration and Travel Time

## - Positionproportional Dead Band and Open/ Close Hysteresis

Execute motor calibration if a potentiometer is connected for closed control or for floating control to monitor the valve opening.
The travel time, which is the time from when the valve is fully open to when it is fully closed, is automatically measured and set at the same time.
The Travel Time parameter must be set for floating control without a potentiometer connected. Set the Travel Time parameter to the time from when the valve is fully open to when it is fully closed.

The valve output hold interval (the interval between open output and closed output ON/OFF points) is set using the Position Proportional Dead Band parameter and the hysteresis is set using the Open/Close Hysteresis parameter. The following diagram shows the relationship to the valve opening.

If the PV is within the PV dead band, control is performed as if the PV is the same as the SP. The PV dead band is set in the PV Dead Band parameter. This function is useful to prevent unnecessary outputs when the PV approaches the SP.

- Operation at

Potentiometer Input Error

The Operation at Potentiometer Input Error parameter is used to select the operation to perform if an error occurs with the potentiometer during closed control. The selections are to stop control or switch to floating control and continue.

Potentiometer errors are not detected if the O or C lines are disconnected on the potentiometer. This function, i.e., the option of stopping control or switching to floating control, is not supported in such cases.

### 4.7 Setting Output Parameters

Control Period

## Direct Operation (Cooling)/Reverse Operation (Heating)

- Control that increases the MV as the PV increases is called direct operation (cooling), and control that increases the MV as the PV decreases is called reverse operation (heating).

- For example, when the present value (PV) is less than the set point (SP) during heating control, the manipulated valuable (MV) is increased in proportion to the difference between the PV and SP. As such, heating control is "reverse operation." Cooling control, which does the opposite, is "direct operation."
- Set the Direct/Reverse Operation parameter to ar-r (reverse operation) or ar-d (direct operation). The default setting is for reverse operation (heating).
- When each channel is used independently for control, set the direct/ reverse operation separately for each channel.

Output Type

## Linear Current Output Type

## - Output Type List

| Outputs |
| :--- |
| OUT1  <br> Output Type for multi-outputs  <br> OUT2  <br> OUT3  <br> OUT4  |

## Output Assignments

- The type of data that is output from each output can be assigned.

- On Controllers with more than one input, the data assignments can also be set for channels 2 and higher for the number of supported channels.

- When outputs are used as control outputs, assignments are made automatically based on the control mode setting as shown on the following page. There is no need to change the assignments.
- To use an output as a transfer output, assign the data you wish to transfer to an unused output. If a transfer output is assigned to a voltage output (for driving SSR), the output will turn OFF.

| Control mode | Controllers with 1 input | Controllers with 2 inputs | Controllers with 4 inputs | Output | Control/Transfer output assignment |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Standard Control | IN1 | IN1 | IN1 | OUT1 | Channel 1 Control Output (Heating) |
|  | --- | IN2 | IN2 | OUT2 | Channel 2 Control Output (Heating) |
|  |  | --- | IN3 | OUT3 | Channel 3 Control Output (Heating) |
|  |  |  | IN4 | OUT4 | Channel 4 Control Output (Heating) |
| Heating/ Cooling Control | IN1 | IN1 | IN1 | OUT1 | Channel 1 Control Output (Heating) |
|  |  |  |  | OUT2 | Channel 1 Control Output (Cooling) |
|  | --- | IN2 | IN2 | OUT3 | Channel 2 Control Output (Heating) |
|  |  |  |  | OUT4 | Channel 2 Control Output (Cooling) |
| Standard Control with Remote SP | --- | IN1 IN2: Remote SP | -- | OUT1 | Channel 1 Control Output (Heating) |

### 4.8 Program Settings

## Outline of Program Functions

- Up to 32 programs can be created and each program can have up to 32 segments as long as the total number of segments does not exceed 256.
- A variety of program profiles can be created using the program link function.

The following diagram shows a program setting example.

## Program Parameters

- Number of Segments
- The maximum number of segments for a program is set using the Number of Segments parameter. The default is 16.
- The relationship between the number of programs and the number of segments that can be set using the Number of Segments parameter is shown in the following table.

| Setting of Number of <br> Segments parameter | Number of pro- <br> grams | Number of seg- <br> ments |
| :--- | :--- | :--- |
| 8 | 32 | 8 |
| 12 | 20 | 12 |
| 16 | 16 | 16 |
| 20 | 12 | 20 |
| 32 | 8 | 32 |

- Program No.
- The program number cannot be changed while a program is being executed.
- The default program number is 1 , except for independent operation. The following table shows the setting ranges.

## - Number of Segments Used

| Setting of Number of <br> Segments parameter | Setting range |
| :--- | :--- |
| 8 | 1 to 32 |
| 12 | 1 to 20 |
| 16 | 1 to 16 |
| 20 | 1 to 12 |
| 32 | 1 to 8 |

- The Number of Segments Used parameter is used to set the number of segments used for a specified program.
- The default is 8 . The following table shows the setting ranges.

| Setting of Number of <br> Segments parameter | Setting range |
| :--- | :--- |
| 8 | 1 to 8 |
| 12 | 1 to 12 |
| 16 | 1 to 16 |
| 20 | 1 to 20 |
| 32 | 1 to 32 |

- Once the program has been executed for the number of segments set for the Number of Segments Used parameter, the program will be in operation completed status. If the setting of the Number of Segments Used parameter is changed to a value smaller than the segment currently being executed in the program, the program will immediately change to operation completed status.
- The Segment Set Point and Segment Time parameters are used to set one segment of a program. The present SP is determined by using the SP of the previous segment as the start point and the SP of the current segment as the end point. A straight line is drawn between these two points and the present SP is the point on that line where the current segment time has elapsed.
- The Segment Time parameter can be set to between 0.00 and 99.59 (hours. minutes or minutes. seconds) or between 0.00.0 and 99.59.9 (minutes. seconds.tenths of seconds). The default is 0.00 or 0.00.0.
- The first segment is a soak segment. To start from a ramp, set the Segment Time parameter for segment 1 to 0 to create a program that starts from segment 2 (when the Operation at Reset parameter is set to "Control Stop").

## ■ Program Setting Example

In this example, the following program will be created as program 2.

The following table shows the settings required for the Number of Segments, Number of Segments Used, and Program No. parameters.

| Parameter | Set value |
| :--- | :--- |
| Number of Segments | 8 (No. of programs: 32) |
| Number of Segments Used <br> (Program No. 2) | 4 |
| Program No. | 2 |

The Segment Set Point and Segment Time parameter settings for program 2 are given in the following table.

| Segment No. | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\boldsymbol{- -}$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Segment Set <br> Point | 50.0 | 100.0 | 100.0 | 50.0 | --- |
| Segment <br> Time (h:min) | $5: 00$ | $8: 00$ | $10: 00$ | $5: 00$ | --- |

Number of Segments Used
25.0
106.5
$0.0:$

Use the following procedure to set the Number of Segments parameter to 8 (thus setting the number of programs to 32 ).
(1) Hold down the $\square$ Key for at least 3 seconds to move from the Operation Level to the Input Initial Setting Level.
(2) In the Input Initial Setting Level, Display No. 3 will show $\leq .8$.

Press theKey for less than 1 second to move to the Control Initial Setting Level.
(3) In the Input Initial Setting Level, Display No. 3 will show $\mathbf{L} .1$.

Press the Key repeatedly (less than 1 second each time) to select the Number of Segments parameter.
(4) Press the $\boxtimes$ to set the Number of Segments parameter to 8 .

Use the following procedure to set the Number of Segments Used parameter to 4 .
(1) Hold down the $\square$ Key for less than 1 second to move from the Operation Level to the Program Setting Level.
(2) The Program Editing parameter will be displayed in the Program Setting Level. Select the number of the program to be edited. For example, to change the Number of Segments Used parameter for program 2, use the Key to select 2 .

(3) Press the Key to display the Number of Segments Used parameter for program 2. Use the 图 and Keys to set the value to 4 .
(4) Hold down the Key for less than 1 second to return to the Operation Level.

## Program No．

25.5
100.0 $01: 5$

Segment Set Point and Segment Time
25.0

1000
01.01

Use the following procedure to set the program to be executed to 2 in the Operation Level．
（1）Press the Key several times to select the Program No．parameter to enable specifying the number of the program to execute．
（2）Use the 人 and $\because$ Keys to set the program number to 2 ．

Use the following procedure to set the Segment Set Point and Segment Time parameters for segments 1 to 4 for program No． 2.
（1）Hold down the $\square$ Key for less than 1 second to move from the Operation Level to the Program Setting Level．
（2）The Program Editing parameter will be displayed in the Program Setting Level．Select the number of the program to be edited．For example，to change the Segment Set Point and Segment Time parameters for program 2，use the 人 and $\mathbb{V}$ Keys to select 2.
（3）Press the Key twice to display the Segment Editing parameter．Select the number of the segment to be edited．First，segment 1 parameters will be edited，so use the 图 Key to select 1 ．
（4）Press the Key for less than 1 second to display the Segment Set Point parameter for segment 1．Use the 图 and Keys to set the Segment Set Point parameter for segment 1 to 50．0．

（5）Press the Key for less than 1 second to display the Segment Time parameter for segment 1．Use the 因 and Keys to set the Segment Time parameter for segment 1 to 5.00 ．
（6）Press the Key several times to display the Segment Editing parameter again．This time the next segment number after the segment that was just edited will be displayed．Check that segment number 2 is displayed．（To edit segment 1 parameters again or to edit parameters for another segment number，use the 因 and $\triangle$ Keys to select the desired segment number．）
（7）Press the Key for less than 1 second to display the Segment Set Point parameter for segment 2．Use the 人 and $\otimes$ Keys to set the Segment Set Point parameter for segment 2 to 100．0．
（8）Press the Key for less than 1 second to display the Segment Time parameter for segment 2．Use the 人 and 능 Keys to set the Segment Time parameter for segment 2 to 8．00．
（9）Press the Key several times to display the Segment Editing parameter again．Check that segment number 3，the next segment to be edited，is displayed．
（10）Press the Key for less than 1 second to display the Segment Set Point parameter for segment 3．Use the 図 and $\approx$ Keys to set the Segment Set Point parameter for segment 3 to 100．0．

（11）Press the Key for less than 1 second to display the Segment Time parameter for segment 3 ．Use the 人 and $\otimes$ Keys to set the Segment Time parameter for segment 3 to 10.00 ．
（12）Press the Key several times to display the Segment Editing parameter again．Check that segment number 4，the next segment to be edited，is displayed．

(13)Press the Key for less than 1 second to display the Segment Set Point parameter for segment 4. Use the 図 and $\approx$ Keys to set the Segment Set Point parameter for segment 4 to 50.0.
(14)Press the Key for less than 1 second to display the Segment Time parameter for segment 4. Use the 因 and Keys to set the Segment Time parameter for segment 4 to 5.00 .

### 4.9 Performing ON/OFF Control

ON/OFF control consists of setting an SP and then having the control output turn OFF when the temperature reaches the SP during control. When the control output turns OFF, the temperature begins to fall, and once it falls to a certain point, the control output turns ON again. This action is repeated around a certain position. ON/OFF control requires setting the Hysteresis (Heating) parameter to the temperature drop from the SP where control output should turn ON. The Direct/Reverse Operation parameter is used to determine whether the MV is increased or decreased with respect to an increase or decrease of the PV.

## ON/OFF Control

## - Hysteresis

- On the E5AR-T/ER-T, switching between advanced PID control and ON/OFF control is accomplished by setting the Proportional Band parameter. When the proportional band is set to 0.00 , ON/OFF control is performed, and when it is set to any value except 0.00 , advanced PID control is performed. The default setting is 10.00 .
- In ON/OFF control, hysteresis is added when switching between ON and OFF to stabilize operation. The width of the hysteresis is called simply the hysteresis. The hysteresis is set for both heating and cooling control output using the Hysteresis (Heating) and Hysteresis (Cooling) parameters.
- For standard control (heating or cooling control), only the Hysteresis (Heating) parameter is used, regardless of whether heating or cooling is being performed.

## - Three-position Control

- For heating/cooling control, an area can be set where the MV is 0 for both heating and cooling. This area is called the dead band. This means that 3-position control can be performed.

## Settings

To perform ON/OFF control, the SP, Proportional Band, and Hysteresis (Heating) parameters must be set.

To ON/OFF control and an hysteresis (heating) of 2.00\% FS, set the Proportional Band parameter to 0.00 in PID Setting Level to select ON/ OFF control.

## Setting ON/OFF Control (Proportional Band $=0.00$ )

## Setting the Hysteresis

1. Press the $\square$ Key for less than 1 second to move from the Operation Level to the Adjustment Level.
2. Press the Key repeatedly to select the Hysteresis (Heating) parameter.
3. Use the 人 and $\otimes$ Keys to set the value to 2.00 .
4. Press the $\square$ Key repeatedly (less than 1 second each time) to return to the Operation Level.

### 4.10 Determining the PID Constants (AT or Manual Settings)

## ■ Auto-tuning (AT)

- When AT is executed, the most suitable PID constants for the current SP are set automatically. This is accomplished by varying the MV to obtain the characteristics of the control object using the limit cycle method.

- The following operations are not possible during AT: Changing settings, holding or releasing the program, and segment operations, such as advance and back operations.
- AT will stop if the Run/Reset parameter is set to "Reset" and the Operation at Reset parameter is set to stop control, or if Manual Mode is entered.
- When executing AT, select 0 to execute AT for the PID set that is currently being used for control, or select 1 to 8 as to execute AT for a specific PID set.
- The results of AT will be reflected in PID Setting Level in the Proportional Band (P), Integral Time (I), and Derivative Time (D) parameters of the PID set number specified at the time AT was executed.
The following operation will be performed if the Operation at Reset parameter is set for fixed control.
- If the Run/Reset parameter is changed from "Run" to "Reset" during AT execution, the present SP will be changed to a fixed set point after AT has been completed.
- If AT is executed while the Run/Reset parameter is set to "Reset" and the Run/Reset parameter is changed from "Reset" to "Run" during AT execution, the set program will be started after completing AT for the fixed SP.

## - Explanation of AT <br> Operation

AT begins when the AT Execute/Cancel parameter is changed from OFF to 0 .

While AT is being executed, ${ }^{[t}$ flashes on Display No. 1. Display No. 2 shows the PID set number currently being used for control. When AT ends, the AT Execute/Cancel parameter goes OFF and the display stops flashing.

AT begins and the displays show the following:
Display No. 1: Flashing display indicating AT is running.
Display No. 2: Shows selected PID set number.

During AT Execution
Present value (PV)/SP (Display 2)

To stop AT, select $\boldsymbol{a r}$ (AT Cancel).

If you attempt to move to the Operation Level and display the PV or SP while AT is being executed, Display No. 2 will flash to indicate that AT is being executed.

- Only the Communications Writing, Run/Reset, AT Execute/Cancel, and Auto/Manual parameters can be changed while AT is running. No other settings can be changed.
- If the Run/Reset parameter is set to "Reset" while AT is being executed, AT will stop and operation will stop. If "Run" is then selected, AT will not resume.
- If an input error occurs while AT is being executed, AT will stop. AT will run again after recovery from the error.

## Limit Cycle

The timing for generating a limit cycle depends on whether or not the deviation (DV) when AT is begun is less than the Temporary AT Excitation Judgement Deviation parameter (default: 10.0\% FS).
The PV changes as follows during AT:

The amplitude of change of the limit cycle MV can be changed in the Limit Cycle MV Amplitude parameter.

For heating/cooling and position-proportional floating control, the limit cycle is as shown below regardless of the deviation.

## Manual Settings

To set the PID constants manually, set values for the Proportional Band (P), Integral Time (I), and Derivative Time (D) parameters

## Supplement

- If you already know the control characteristics, directly set the PID constants to adjust control. The PID constants are set in the Proportional Band (P), Integral Time (I), and Derivative Time (D) parameters.
- I (integral time) and D (derivative time) can be set to 0 to select a proportional action. In the default settings, the Manual Reset Value parameter is set to $50.0 \%$ so that the proportional band is centered on the SP.

## Changing P (Proportional Band)

| When $P$ is <br> increased | A slow rise and a longer rec- <br> tification time will occur, but <br> there will be no overshoot. |
| :--- | :--- | :--- |
| When $P$ is <br> decreased | Overshoot and hunting will <br> occur, but the SP will be <br> reached quickly and stabi- <br> lize. |

Changing I (Integral Time)

| When $P$ is <br> increased | A longer time will be required <br> to reach the SP. <br> The rectification time will be <br> longer, but there is less hunt- <br> ing, overshooting, and under- <br> shooting. |
| :--- | :--- | :--- |
| When $P$ is <br> decreased | Overshooting and under- <br> shooting will occur. <br> Hunting will occur. <br> A quick rise will occur. |

## Changing D (Derivative Time)

| When P is <br> increased | Less rectification time for <br> overshooting and under- <br> shooting, but fine hunting will <br> occur spontaneously. |
| :--- | :--- | :--- |
| When P is <br> decreased | Overshooting and under- <br> shooting will be larger and <br> more time will be required to <br> return to the SP. |

### 4.11 Using Auxiliary Outputs

The Auxiliary Output * Assignment, Alarm Type, Alarm Value, Alarm Upper Limit, Alarm Lower Limit, and Alarm Set Number parameters are described in this section.

## Auxiliary Output Assignments

The type of data that is output from each auxiliary output can be assigned.

On Controller models with more than one output, data assignments can also be set for channels 2 and higher for the number of supported channels.

The U-ALM Output setting is an OR output of alarms 1 to 4 of all channels (overall alarm).

The default settings are as follows:

| SUB1 | SUB2 | SUB3 | SUB4 |
| :---: | :---: | :---: | :---: |
| Channel 1 Alarm 1 | Channel 1 Alarm 2 | Channel 1 Alarm 3 | Channel 1 Alarm 4 |

The E5ER-T $\square \square \square \square$ has only two auxiliary outputs, i.e., they do not have SUB3 and SUB4.

## Alarm Types

*1: Set values 1, 4, and 5: Allow upper and lower limits of alarm to
be separately set. The upper and lower limits are indicated by $L$ and $H$.
*2: Set value 1: Upper-and lower-limit alarm

*3: Set value 4: Upper-and lower-limit range

*4: Set value 5: Alarm with upper-limit and lower-limit with standby sequence
*With the above upper-and lower-limit alarms

- Cases 1 and 2:
- Case 3: Always OFF

If hysteresis overlaps the upper
and lower limits, always OFF
*5: Set value 5: Alarm with upper-and lower-limit standby sequence
If hysteresis overlaps the upper and lower limits, always OFF.
*6: For information on standby sequences, refer to 5.6 Alarm Adjustment Functions.

Under the following conditions, the SP of segment 1 is used as the SP for deviation alarms.

- If the Operation at Reset parameter is set to stop control and the program is reset in Program SP Mode
- If the Operation at Reset parameter is set to stop control and the program is placed on standby in Program SP Mode

## Alarm Values

## Alarm Sets

## Settings

Auxiliary Output 2 Assignment

- A group of alarm values is called an alarm set. The Alarm Set Number parameter is set for each program.
- Alarm set numbers can be set between 1 to 4 . The default is 1 . For channels 2 to 4 during coordinated operation and the secondary side (channel 1) during cascade control, however, alarm set numbers can be between 0 and 4 . If 0 is selected, the alarm set number will be the same as the number selected for channel 1.
Alarm values are indicated by " $X$ " in the alarm type table. When separate upper and lower limits are set for an alarm, the upper limit value is indicated by "H" and the lower limit is indicated by "L."

When an upper- and lower-limit alarm, upper- and lower-limit range alarm, or lower-limit alarm with standby sequence is selected, the Alarm Upper Limit and Alarm Lower Limit parameters must be set.
The Alarm Value parameter must be set when any other alarm type is selected.

To output an alarm to an auxiliary output, the Auxiliary Output Assignment, Alarm Type, and Alarm Value parameters must be set.
To output a lower-limit alarm to auxiliary output 2 using channel 1 alarm 1 at an alarm value of $10.0^{\circ} \mathrm{C}$, the Auxiliary Output 2 Assignment parameter is set to "CH 1 alarm 1" in the Control Initial Setting 2 Level.

1. Hold down the $\square$ Key for at least 3 seconds to move from the Operation Level to the Input Initial Setting Level.
2. In the Input Initial Setting Level, Display No. 3 will show 1.8.

Press the $\square$ Key twice (less than 1 second each time) to move to the Control Initial Setting 2 Level.
3. In the Control Initial Setting 2 Level, Display No. 3 will show $\mathbb{L} . \boldsymbol{Z}$. Press the Key repeatedly (less than 1 second each time) to select the Auxiliary Output 2 Assignment parameter.

Alarm 1 Type

| $\mathrm{OCH}_{\mathrm{CH}} \mathrm{BE} \text { 1 }$ | Alarm 1 type |
| :---: | :---: |
| II |  |
|  $1.3$ |  |

4. Press the to set the Auxiliary Output 2 Assignment parameter to $1(\mathrm{CH}$ 1 Alarm 1).

Set Alarm 1 Type parameter to a "Lower-limit Alarm" in the Alarm Setting Level.
5. Press the $\square$ Key for less than 1 second to move to the Alarm Setting Level.
The display will show the Alarm 1 Type parameter.
6. Press the Key to select 3 (Lower-limit Alarm).

Set the Alarm Set Alarm Value 1 parameter to $10.0^{\circ} \mathrm{C}$ in the Alarm Set Setting Level.
7. Hold down the $\square$ Key for at least 1 second to move to the Operation Level.
8. Press the $\square$ Key three times (less than 1 second each time) to move to the Alarm Set Setting Level.
9. Press the Key repeatedly to select the Alarm Set 1 Alarm Value 1 parameter.
Press the 因 Key to change the set value to 10.0 .

### 4.12 Starting and Stopping Operation

## Starting Operation (Run) and Stopping Operation (Reset)

To start program operation, set the Run/Reset parameter to "Run." To stop program operation, set the Run/Reset parameter to "Reset." Program execution will stop if the Hold parameter is set to "ON."

- Operation at Reset

The operation status when the Run/Reset parameter is set to "Reset" can be selected. The two operation statuses outlined below can be selected by using the Operation at Reset parameter.

- Operation at Reset Parameter Set to "Control Stop" The following diagram shows the status transition when the Operation at Reset parameter is set to "control stop."

Note1: Program operation starts from the segment 1 SP .
2: Control is stopped while resetting.
3: The status switches to fixed control in SP mode.
Control stop is held when the mode is shifted to fixed control (Fixed SP Mode) or Remote SP Mode during the reset.

- When using Standard Models, set the MV at Reset parameter to between $-5.0 \%$ and $105.0 \%$ to output during reset. The default is $0.0 \%$. (For heating/cooling control, set the MV at Reset parameter to between $-105.0 \%$ and $105.0 \%$.)
- When using the Position-proportional Models, fully open, fully closed, or hold status can be selected using the MV at Reset parameter. In open status, only the output on the open side is ON. In closed status, only the output on the closed side is ON. In hold status, the outputs on both the open and closed sides are OFF. The default setting is "hold."
- Operation at Reset Parameter Set to "Fixed Control" The following diagram shows the status transitions when the Operation at Reset parameter is set to "fixed control."

Note1:The program moves into Program SP Mode and program operation starts from the fixed SP.
2: Control does not stop. Control is executed for the fixed SP. (The program moves into Fixed SP Mode.) Control is executed for the remote SP when the program moves into Remote SP Mode.

- If the Operation at Reset parameter is set to "fixed control," the first segment will become a ramp segment.
- The following table shows example settings.

| Segment No. | $\mathbf{1}$ | 2 | $\mathbf{3}$ | --- |
| :--- | :--- | :--- | :--- | :--- |
| Segment SP | 100.0 | 100.0 | 50.0 | --- |
| Segment Time <br> (h:min) | $8: 00$ | $10: 00$ | $5: 00$ | --- |

## - Operation at Power ON

- This parameter determines the operating status when the power to the E5AR-T/ER-T is turned ON. The following 5 selections are possible.

| Setting | Operation |
| :---: | :--- |
| Continue | The status of the system before the power was <br> turned OFF is resumed. |
| Reset | Control is always reset status when the power is <br> turned ON. |
| Manual Mode | Manual Mode is entered when the power is turned <br> ON. |
| Run | The program is always executed from the begin- <br> ning when the power is turned ON. |
| Ramp back | The SP starts from the present value when the <br> power is turned ON and ramp operation is per- <br> formed with the previous ramp slope. |

- The following table shows what values are held depending on the Operation at Power ON parameter setting.

| Parameter | Continue <br> (See note <br> 1.) | Reset | Manual | Run |
| :--- | :--- | :--- | :--- | :--- |
| Program No. | Held | Held | Held | Held |
| Segment No. | Held | --- | Held | --- |

| Parameter | Continue <br> (See note <br> 1.) | Reset | Manual | Run |
| :--- | :--- | :--- | :--- | :--- |
| Elapsed Program/ <br> Segment Time | Held | --- | Held | --- |
| Program Repetitions | Held | --- | Held | --- |
| Hold Status | Held | --- | Held | --- |
| Auto/Manual | Held | Held | --- | Held |
| Manual MV <br> (See note 3.) | Held | Held | Held <br> (See note 4.) | Held |
| Run/Reset | Held | --- | Held | --- |

Note1:Including "Ramp Back."
2: If a PV start causes an invalid period, time will be considered to have elapsed for the invalid period.
The elapsed program and segment timers will operate as outlined below when "Ramp Back" has been set for the Operation at Power ON parameter:

- If power is interrupted while soaking, the timer will stop until the present SP returns to the segment SP.
- If power is interrupted during ramp operation, the timer is restarted using the PV immediately after power is restored as the PV when power was interrupted.
3:For the Standard Models in Manual Mode at the power interruption.

4: If power is interrupted in Auto Mode, the value set for the MV at Reset parameter will be output, unless the Manual Output Method parameter is set to "Output Initial Value." If the Manual Output Method parameter is set to "Output Initial Value," the value set for the Manual MV Initial Value parameter will be output.

5:For coordinated operation, the channel 1 values for the Program No., Segment No., Elapsed Program Time, Elapsed Segment Time, Program Repetitions, and Hold Status parameters will be used for the other channels.

- The default setting for the Operation at Power ON parameter is "Continue."
- Set the Operation at Power ON parameter for each channel.
- If the control mode is set to cascade control, set the Operation at Power ON parameter for channel 2.
- The operation when the Operation at Power ON parameter is set to "Ramp Back" is described below.
- Power Interrupted during a Soak Segment

If power is interrupted during a soak segment and then restored, the ramp slope for the immediately preceding ramp segment is continued and ramp operation is executed from the PV immediately after power is restored to the target SP.

- If there is no ramp segment before the power interruption, the PV immediately after the power is restored will be held as the present SP and operation will be executed as a soak segment.
The ramp slope of the immediately preceding ramp segment is continued even if the program direction (temperature increasing/ decreasing) is different from the ramp segment. Ramp operation is executed from the PV immediately after power is restored to the target SP.
If an input error occurs when the power is restored, control is executed using the SP of the soak segment when power was interrupted.

- Power Interrupted during a Ramp Segment

If power is interrupted during a ramp segment, the PV when power is restored will be used as the start point for the present SP and ramp operation will be executed at the ramp slope before the power interruption.
The ramp operation using the same ramp slope is the same as when the Step Time/Rate of Rise Programming parameter is set to "step time." The time taken to reach the target SP will not match the set segment time.

The ramp slope of the immediately preceding ramp segment is continued even if the program direction (temperature increasing/ decreasing) is different from the ramp segment.

If an input error occurs when power is restored, the program moves to the next segment.

The program timer value is held until the program returns to the status before the power was interrupted.

- Power Interrupted in Fixed SP or Remote SP Mode

Ramp operation is not executed for a fixed SP or remote SP if the power is interrupted in Fixed SP Mode or Remote SP Mode.

## Other

- The timer continues when the mode is changed to Manual Mode during program operation.
- The timer continues if an input error occurs during program operation.
- In setting area 1 , the time signal, segment output, program end output, and segment number output are all OFF.
- The program operation is also reset if the Run/Reset parameter for the secondary side (channel 2 ) is set to "Reset" when using cascade control.

## Settings

The following procedure is used to stop program operation.

## *Run/Reset Selected for the PF1 Setting or PF2 Setting Parameter

1. Press the PF Key for which Run/Reset has been specified for at least 1 second. The RST indicator will light and the program will stop.
To start operation again, press the same PF Key for at least 1 second again. The RST indicator will turn OFF and the program will start operation.

## - "Run/Reset" Not Selected for the PF1 Setting or PF2 Setting Parameter

(1) Press the Key several times to select r-r: Run/Reset.
(2) Press the 图 Key to switch to $-5 t$ : Reset. The RST indicator will light and the program will stop.
To restart the program, use the same procedure to switch to rim: Run. The RST indicator will turn OFF and the program will start.

## Hint

Switching between run and reset is also possible using an event input or communications.
For event inputs, refer to 5.8 Using Event Inputs (P. 5-39). For communications, refer to 5.10 Using Communications (P. 5-49).

### 4.13 Manual Operation

## Manual Mode

## - Standard Control Models

## - Position-

 proportional Control Models- In standard control, the MV is manipulated, and in position-proportional control, the amount of valve opening is manipulated.
- To perform manual operation or to manually set the MV or valve opening, set the Manual/Auto parameter to $\operatorname{ninnid}$ (Manual), or set the PF Setting parameter to $\boldsymbol{P}-\boldsymbol{r}$ (Auto/Manual) and then hold down the PF Key for at least 1 second.
- The MANU operation indicator lights in Manual Mode. The PV is displayed on Display No. 1, the MV is displayed on Display No. 2, and rinis is displayed on Display No. 3.
- To change the MV, press the 图 and Keys. The MV is updated every 50 ms .
- When switching between Manual Mode and Auto Mode, the action of the MV is balance-less and bumpless.
- Other setting levels can be moved to in Manual Mode. However, the AT Execute/Cancel parameter cannot be selected and does not appear on the display.
- Switching between auto and manual is possible a maximum of 100,000 times.
- If switching is performed more than 100,000 times, the auto/manual settings will not be written to EEPROM.
- During cascade control, if the primary loop is switched to manual control when the secondary loop is in any of the following conditions, the manual MV is disabled.
- The secondary loop is in Local SP Mode (cascade open).
- The secondary loop is in Manual Mode.
- The operation set for an error is being performed for the secondary loop.
- When a potentiometer is connected, MANU operation indicator lights in Manual Mode. The PV is displayed on Display No. 1, the valve opening is displayed on Display No. 2, and rinit is displayed on Display No. 3. When a potentiometer is not connected, Display No. 2 shows "-----."
- To turn ON the open output, press the 图 Key. To turn ON the close output, press the $\approx$ Key. The MV is updated every 50 ms .
- When switching between Manual Mode and Auto Mode, the action of the MV is balance-less, bumpless.
- Other setting levels can be moved to in Manual Mode. However, the AT Execute/Cancel parameter cannot be selected and does not appear on the display.
- Switching between auto and manual is possible a maximum of 100,000 times.
- If switching is performed more than 100,000 times, the auto/manual settings will not be written to EEPROM.

The procedure for switching to Manual Mode during control and changing the MV is given below.

## - Auto/Manual Set for PF1 or PF2 Setting

1. Hold down the PF Key set to switch between auto and manual at least 1 second. The MANU indicator will light and the mode will change to Manual.

To return to Auto Mode, hold down the PF Key for at least 1 second. The MANU indicator will go OFF and the mode will change to Auto Mode.

- Auto/Manual Not Set for PF1 or PF2 Setting

2. Press the Key to switch to rifin (Manual). The MANU indicator will light and the mode will change to Manual.

To resume control, follow the same procedure to switch back to 品ta (Auto). The MANU indicator will go OFF and the mode will change to Auto Mode.

Switching between Auto and Manual Mode is also possible using an event input or communications.
For event inputs, refer to 5.8 Using Event Inputs (P. 5-39). For communications, refer to 5.10 Using Communications (P. 5-49).

### 4.14 Changing Channels

## Changing Channels

Present value (PV) / SP

## Level after <br> Changing <br> Channels

Displayed
Parameter after
Changing
Channels

- On Controllers with more than one input, the channel number increases by 1 each time the CH Key is pressed and the displayed channel changes accordingly.
- Only channels that are enabled with the Number of Enabled Channels parameter can be displayed.
- If the Number of Enabled Channels parameter is set to 2 on a 4point input type, the display will switch through the channels as follows each time the CH Key is pressed:
Channel $1 \rightarrow$ Channel $2 \rightarrow$ Channel $1 \rightarrow$ Channel 2...
- When changing channels, the level will remain the same as the level currently being displayed.
- When a Manual Mode channel is selected, the display will show the manual operation display in the Operation Level.
- The displayed parameter after changing channels is as follows:

1. If the parameter that is currently being displayed will continue to be displayed if it is enabled for the new channel.
2. If the parameter that is currently being displayed is not enabled for the new channel because the control method is different or for any other reason, the next enabled parameter will be displayed.
The following is an example of changing channels in the Operation Level.

If you continue to hold down the CH Key after changing channels, you will not move to the next channel. To continue changing channels, release and press the $\triangle \mathrm{CH}$ Key again.
For more information, refer to 5.4 Display and Key Adjustment Functions (P. 5-18).

### 4.15 Adjusting Programs

The temperature vector will change if the program is changed during operation when step time operation is used. This section describes the vector changes.

## Changing the SP

If the SP is changed during a segment, the present SP will move in a straight line with the changed SP as the target point.

## Changing the Time

If the time is changed during a segment, the slope of the line along which the present SP moves will change because the time taken to reach the target will change.

If the segment time after the change is shorter than the elapsed segment time, the program will immediately move to the next segment.

### 4.16 Operating Precautions

(1) About four seconds is required for the outputs to turn ON after the power is turned ON. Take this into consideration when incorporating the Controller into a sequence circuit.
(2) Using the Controller near radios, televisions, or other wireless devices may cause reception interference.

### 5.1 Input Adjustment Functions

## Input Correction

- The input value can be corrected using a 2-point correction.
- A temperature difference that occurs due to the positioning of the control sensor in respect to the position where the temperature is required can be rectified using the input correction values.
- Two-point Correction

| Parameter | Setting range | Unit | Default <br> value |
| :--- | :--- | :--- | :--- |
| Input Value 1 for Input Correction | -19999 to 99999 | EU | -200.0 |
| Input Value 2 for Input Correction | -19999 to 99999 | EU | 1300.0 |
| Input Correction 1 | -199.99 to 999.99 | EU | 0.00 |
| Input Correction 2 | -199.99 to 999.99 | EU | 0.00 |

- Straight-line correction is accomplished by setting the Input Correction 1 parameter to the desired value for the input value set in the Input Value 1 for Input Correction parameter and setting the Input Correction 2 parameter to the desired value for the input value set in the Input Value 2 for Input Correction parameter. Different degrees of correction may be required for the Input Correction 1 and Input Correction 2 parameters and thus the slope of the line between the two points may differ before and after correction.
- Input correction is set separately for each channel. The input correction settings for inputs 1 to 4 of a Controller with more than one input correspond to channels 1 to 4 . First select a channel with the $[\mathrm{CH}$ Key and then set the corresponding input correction values.

## - Obtaining Input

Correction Values
for 2-point
Correction

## Preparations

Temperature readings are taken using the E5AR-T/ER-T at any two points: the actual temperature at the required location (the object) and the present temperature of the E5AR-T/ER-T.

1. Set the input type based on the sensor.
2. Obtain a temperature sensor that can measure the temperature of the object as shown in Figure 1.

Figure 1. Configuration for Input Correction

## - Procedure for <br> Using a 2-point Correction

1. Correction will be performed based on the temperature readings at two points: one near room temperature and one near the desired SP. Measure the temperature of the object when it is near room temperature and when it is near the $\mathrm{SP}(\mathrm{B})$, and check the corresponding readings of the Controller (A) at the same temperatures.
2. Set the Input Correction 1 parameter to the difference between the temperature of the object (B) and the Controller reading (A) when near room temperature,

> Object temperature (B) - Controller reading (A)
and set the Input Value 1 for Input Correction parameter to the Controller reading (A).
3. Set the Input Correction 2 parameter to the difference between the temperature of the object $(B)$ and the corresponding Controller reading (A) when near the SP,
Object temperature (B) - Controller reading (A)
and set the Input Value 2 for Input Correction parameter to the Controller reading (A).
4. After making the settings, check the reading of the Controller $(A)$ and the temperature of the object (B).
5. Correction has now been performed at two points, near room temperature and near the SP. If you wish to improve the accuracy near the SP, establish two more correction points above and below the SP. Figure 2 illustrates the correction.

- Example of 2-point Correction

Input Value 1 for Input Correction

Input Shift 1

Input Value 2 for Input Correction

Input Shift 2

Figure 2. Two-Point Correction
The following example for a K typing input (1) from -200 to $1300^{\circ} \mathrm{C}$.

- The temperature of the object is obtained.

At room temperature $\left((B)=25^{\circ} \mathrm{C}\right)$,
the Controller reading is $\quad(\mathrm{A})=40.0^{\circ} \mathrm{C}$

Near the $\mathrm{SP}\left((\mathrm{B})=550^{\circ} \mathrm{C}\right)$,
the Controller reading is

$$
(\mathrm{A})=500.0^{\circ} \mathrm{C}
$$

- In this case, the input correction values are obtained as follows:

Input Value 1 for Input Correction $=$ Controller reading $(\mathrm{A})=40.0\left({ }^{\circ} \mathrm{C}\right)$
Input Correction 1
$=$ Temperature of object $(B)-$ Controller reading $(A)$
$=25-40=-15.00\left({ }^{\circ} \mathrm{C}\right)$

Input Value 2 for Input Correction $=$ Controller reading $(\mathrm{A})=500.0\left({ }^{\circ} \mathrm{C}\right)$ Input Correction 2
$=$ Temperature of object (B) - Controller reading (A)
$=550-500=50.00\left({ }^{\circ} \mathrm{C}\right)$

## ■ First Order Lag Operation

First Order Lag
Operation 1 Enabled

First Order Lag Operation

- A first order lag operation serves as a filter for an input. For a Controller with more than one input, the operation is set for each of inputs 1 to 4 in the First Order Lag Operation 1 to 4 parameters.
- To use a first order lag, set the First Order Lag Operation Enabled parameter to "ON" (the default setting is OFF). The First Order Lag Operation Time Constant parameter must also be set, and it is set so that the result of the operation is 0.63 times the input data.

| Parameter | Setting range | Unit | Default <br> value |
| :--- | :--- | :--- | :--- |
| First Order Lag Operation <br> 1 to 4 Enabled | OFF: Disabled, <br> ON: Enabled | - | OFF |
| First Order Lag Operation <br> 1 to 4 Time Constants | 0.0 to 999.9 | s | 0.0 |

- The moving average operation reduces sudden changes in the input due to noise and other factors, and can be enabled separately for each input.
- To use the moving average operation, set the Movement Average Enabled parameter to "ON" (the default setting is OFF).
- A count must also be selected in the Move Average 1 to 4 Move Average Count parameter. Selections are 1, 2, 4, 8, 16, and 32 times.

| Parameter | Setting range | Unit | Default <br> value |
| :--- | :--- | :--- | :--- |
| Movement Average <br> 1 to 4 Enabled | OFF: Disabled, ON: <br> Enabled | - | OFF |
| Move Average 1 to 4 <br> Move Average Count | $1,2,4,8,16,32$ | Times <br> (count) | 1 |

## Broken-line Approximation

Broken-line approximation is used to correct non-linearity in the input. Twenty broken-line approximation points can be set for input 1.

To use broken-line approximation, set the Broken-line Approximation enabled parameter to "ON" (the default setting is OFF).
Broken-line approximation includes the Broken-Line Approximation 1 Inputs 1 to 20 and Broken-line Approximation 1 Outputs 1 to 20 parameters. Normalized data is used to set the values so that the lower limit of the input setting range for input 1 is 0.000 and the upper limit is 1.000 .

- Relation to Input Types
Broken-line
Approximation 1 Enabled

Broken-line Approximation 1 Input 1

Broken-line
Approximation 1 Output 1

- Normalized data is used to set the values for broken-line approximation so that the lower limit of the input setting range for input 1 is 0.000 and the upper limit is 1.000 . For example, if the input type of input 1 is $\mathrm{J}(2)\left(-20.0\right.$ to $\left.400.0^{\circ} \mathrm{C}\right)$ and the broken-line approximation is to be applied to one point, $190.0^{\circ} \mathrm{C}$, the values are set as follows:

Broken-line Approximation 1 Input $1=0.000$
Broken-line Approximation 1 Output $1=0.000$
Broken-line Approximation 1 Input $2=0.500$
Broken-line Approximation 1 Output $2=0.750$
Broken-line Approximation 1 Input $3=1.000$
Broken-line Approximation 1 Output $3=1.000$

| Parameter | Setting range | Unit | Default <br> value |
| :--- | :--- | :--- | :--- |
| Broken-line <br> Approximation 1 Enabled | OFF: Disabled, <br> ON: Enabled | - | OFF |
| Broken-line <br> Approximation 1 Input 1 <br> to <br> Broken-line Approximation 1 <br> Input 20 | -1.999 to 9.999 | - | 0.000 |
| Broken-line Approximation 1 <br> Output 1 <br> to <br> Broken-line Approximation 1 <br> Output 20 | -1.999 to 9.999 | - | 0.000 |

## ■ Extraction of Square Root

Extraction of Square Root 1 Enabled

Extraction of Square Root 1 Low-cut Point

- An extraction of square root operation is supported for each input to allow direct input of the signal from a pressure differential flow meter.
- To use the extraction of square root operation, set the Extraction of Square Root Enabled parameter to "ON" (the default setting is OFF).
- The extraction of square root function includes an Extraction of Square Root Low-cut Point parameter that will set the result to 0 when the result of the operation is below the low-cut point. The lowcut point is set for each input using normalized data so that the lower limit of the input setting range is 0.000 and the upper limit is 1.000 .

| Parameter | Setting range | Unit | Default <br> value |
| :--- | :--- | :--- | :--- |
| Extraction of Square Root 1 <br> to 4 Enabled | OFF: Disabled, <br> ON: Enabled | - | OFF |
| Extraction of Square Root <br> Low-cut Point 1 to 4 | 0.000 to 9.999 | EU | 0.000 |

## Other Input Adjustments

The following input adjustment functions are also available. These functions are explained in Section 8 Parameters (P. 8-1).

- Sensor Induction Noise Reduction: Input Initial Setting Level
- PV Decimal Point Display: Input Initial Setting Level

### 5.2 Control Functions

## Alarm Sets

- Up to 4 alarm sets with registered alarm values can be created.

| Alarm set number | $\mathbf{1}$ | $\mathbf{2}$ | ․ . | 4 |
| :--- | :--- | :--- | :--- | :--- |
| Alarm Values 1 to 4 | 240.0 | 300.0 |  |  |
| Alarm Upper Limits 1 to 4 | 40.0 | 30.0 |  |  |
| Alarm Lower Limits 1 to 4 | 40.0 | 30.0 |  |  |

## - Alarm Values

Alarm Set 1
Alarm Upper Limit 1

Alarm Set 1 Alarm Lower Limit 1

## - Procedure

Operation Level

- The alarm values for alarms 1 to 4 are set according to the alarm type. Alarms for which the Alarm Type parameter is set to 0 ("No Alarm") will not be displayed.
- Refer to 4.11 Using Auxiliary Outputs (P. 4-37) for information on how to set parameters.
- The first number in the setting is the alarm set number.

This section describes how to set the Alarm Set 2 Alarm Value 1 parameter. The settings in the following table are used as an example.

| Alarm set number | $\mathbf{1}$ | $\mathbf{2}$ | $\boldsymbol{\text { W P }}$ | $\mathbf{4}$ |
| :--- | :---: | :---: | :---: | :---: |
| Alarm Value 1 |  | 250.0 |  |  |

Operation Level (PV/SP)

Display Alarm Set Selection

Alarm Set 2 Alarm Value 1

(1) Press the $\square$ Key repeatedly to move to the Alarm Set Setting Level parameter (Display No. 3 will show $\mathbf{L}$. OLin. $_{\text {. }}$ ).
(2) Use the 因 and $\approx$ Keys to set the Display Alarm Set Setting Selection parameter to 2.
(3) Press the Key to select the Alarm Set 2 Alarm Value 1 parameter.
(4) Use the 人 and $\triangle$ Keys to set the value to 250.0.

SP upper and lower limits can be set within the input setting range.
If an SP limit is changed so that the SP is outside of the limit, the previous SP set value will be automatically changed to the new value of the SP limit.

Example: Initially, the SP is $200^{\circ} \mathrm{C}$, the SP upper limit is $300^{\circ} \mathrm{C}$, and the SP lower limit is $100^{\circ} \mathrm{C}$. If the SP upper limit is changed to $150^{\circ} \mathrm{C}$, the SP will fall outside of the SP limit range of 100 to $150^{\circ} \mathrm{C}$, and thus will be changed to $150^{\circ} \mathrm{C}$.

If the Input Type, Temperature Unit, or scaling parameters are changed, the SP upper and lower limits will be reset to the upper and lower limits of the input setting range.

The SP limits are set separately for each channel.

$\Delta$ Set value $\boldsymbol{\nabla}$ SP Upper Limit and SP Lower Limit $\nabla$ Upper Limit to Lower Limit of Sensor Range

SP Lower Limit

## PID Sets

The E5AR-T/ER-T allows parameters to be grouped for use in PID control. A group of parameters is called a PID set. A PID set consists of the following parameters.

| PID set number | $\mathbf{1}$ | 2 | . . | 8 |
| :--- | :--- | :--- | :--- | :--- |
| P (Proportional Band) | 20.50 | 35.70 |  |  |
| I (Integral Time) | 240.0 | 300.0 |  |  |
| D (Derivative Time) | 40.0 | 30.0 |  |  |
| MV Upper Limit | 105.0 | 95.0 |  |  |
| MV Lower Limit | -5.0 | 5.0 |  |  |
| Automatic Selection Range <br> Upper Limit | 200.0 | 400.0 |  |  |

- Select the PID set number in the Display PID Selection parameter of the PID Setting Level, and set the value for each PID constant.
- Procedure

PID 3 Proportional Band

## - Automatic

 Selection of the PID SetSet the $P$ (Proportional Band) parameter of PID set 3 to $50.00 \%$ FS.

1. Press the $\square$ Key repeatedly to move to the PID Setting Level (Display No. 3 will show $\boldsymbol{P}_{\text {d }}$ ).
2. Use the 人 and Keys to set the Display PID Selection parameter to 3 .
3. Press the Key to select the PID 3 Proportional Band parameter. To check the PID set number, use the leading digit of the parameter.
4. Use the 図 and Keys to set the value to 50.00 .

- One of the PID set numbers 1 to 8 can be set in the PID Set Number parameter in the Program Setting Level. If the PID Set Number parameter is set to 0 , the PID set will be automatically selected (PID Set Automatic Selection).
- If the PID Set Number parameter is set to 0 for channels 2 to 4 during coordinated operation or for the secondary side (Channel 2) during cascade control, the PID set number selected for channel 1 will be used.
- If the PID Set Number parameter is set to 0 , the PID set will be automatically selected based on the pre-set conditions (PID Set Automatic Selection).

| PID set | Automatic Selection <br> Range Upper Limit |
| :---: | :---: |
| 1 | 200.0 |
| 2 | 400.0 |
| 3 | 500.0 |
| 4 | 600.0 |
| 5 | 700.0 |
| 6 | 800.0 |
| 7 | 1000.0 |
| 8 | 1300.0 |

In the example at left, the PID Set Automatic Selection Data parameter is set to "PV."
When PV $\leq 200.0^{\circ} \mathrm{C}$, PID Set 1 is used
When $200.0<\mathrm{PV} \leq 400.0^{\circ} \mathrm{C}$, PID Set 2 is used
The PID Automatic Selection Range Upper Limit parameters are set so that the values increase as the PID set numbers increase.

The value for PID set 8 is internally fixed so that the Automatic Selection Range Upper Limit parameter is set to $999.9 \%$ FS.
To prevent chattering when changing PID sets, hysteresis can be set in the PID Set Automatic Selection Hysteresis parameter.
The PV, DV (deviation), or SP can be set for the PID Set Automatic Selection Data parameter.

| Parameter | Setting range | Unit | Default <br> value |
| :--- | :--- | :--- | :--- |
| PID Set Number | 0: Automatic <br> 1 to 8: PID Sets 1 to 8 | - | 0 |
| PID Sets 1 to 8 Automatic <br> Selection Range Upper Limit | -19999 to 99999 | EU | 1450.0 |
| PID Set Automatic Selection <br> Data | $0:$ PV, 1: DV, 2: SP | - | $0:$ PV |
| PID Set Automatic Selection <br> Hysteresis | 0.10 to 99.99 | $\% F S$ | 0.50 |

## Operating Programs Using Multiple Channels

## - Models with Two Inputs

(1) Independent

Operation

Independent operation or coordinated operation can be used when 2channel standard control or 2-channel heating/cooling control is selected.

Note: Multi-channel program operation is not possible if heating/ cooling control is selected for a model with two outputs.

The following table shows the number of programs if the Independent Operation/Coordinated Operation parameter is set to "Independent Operation."

| Number of <br> segments | Channel 1 |  | Channel 2 |  |
| :--- | :--- | :--- | :--- | :--- |
|  | Number of <br> programs | Setting <br> range | Number of <br> programs | Setting <br> range |
| 8 | 16 | 1 to 16 | 16 | 1 to 16 |
| 12 | 10 | 1 to 10 | 10 | 1 to 10 |
| 16 | 8 | 1 to 8 | 8 | 1 to 8 |
| 20 | 6 | 1 to 6 | 6 | 1 to 6 |
| 32 | 4 | 1 to 4 | 4 | 1 to 4 |

(2) Coordinated Operation

- Coordinated operation based on channel 1 is possible when the Independent Operation/Coordinated Operation parameter is set to "Coordinated Operation." The program will be the same for both channel 1 and channel 2.
- As shown in the diagram on the right, coordinated operation is enabled when the channel 1 program pattern is input to the channel 2 remote SP.
- The present SP or the PV can be set as the program pattern from channel 1. If the PV is set and channel 1 has an input error, an RSP input error will occur for channel 2.
- An offset can be set for channel 2.
- Any change in the Run/Reset parameter selection for channel 1 will also be changed for channel 2. The channel 2 Run/Reset parameter can, however, be set independently.
- Advance, hold, and back segment operations will be executed for both channels.
- Coordinated operation based on channel 1 is possible. The program will be the same, therefore, for all channels.
- As shown in the diagram on the right, coordinated operation is enabled when the channel 1
 program pattern is input to the remote The present SP or the PV can be set as the program pattern from channel 1. If the PV is set and channel 1 has an input error, an RSP input error will occur for channels 2 to 4.
- Any change in the Run/Reset parameter selection for channel 1 will also be changed for channels 2 to 4 . Each Run/Reset parameter for channels 2 to 4 can, however, be set independently.
- Advance, hold, and back segment operations will be executed for all channels.

## Disturbance Overshoot Adjustment

Disturbance Overshoot Adjustment Function

## - Disturbance Gain

Disturbance Gain

- The disturbance overshoot adjustment function adjusts the control waveform when disturbance occurs.
- To use this function, set the Disturbance Overshoot Adjustment Function parameter to "ON" (the default setting is "OFF").
- The disturbance response waveform can be adjusted using the Disturbance Gain and Disturbance Time Constant parameters.
- The Disturbance Gain parameter can be increased to reduce overshooting when disturbance occurs.
- The Disturbance Gain parameter can be decreased to increase overshooting when disturbance occurs.
- When the Disturbance Gain parameter is set to 0 , the disturbance overshoot adjustment function does not operate.

- The reset time after disturbance can be lengthened by increasing the disturbance time constant. (The default value of 1 is normally used for the disturbance time constant. If adjustment of the disturbance gain alone is not sufficient, this value can be adjusted for finetuning.)

- The waveform may vary from that in the diagram depending on differences in the object of control and differences in PID constants.

## - Conditions for Activating Disturbance Overshoot Adjustment

Disturbance Rectification Band

Disturbance Judgement Width

- If the deviation is greater than the value set for the Disturbance Judgement Width parameter after the PV is rectified to the value set for the Disturbance Rectification Band parameter, the disturbance overshoot adjustment function is activated.
- When the disturbance judgement width is a positive value, disturbance overshoot adjustment will activate when a disturbance occurs that makes the PV fall. When the disturbance judgement width is a negative value, disturbance overshoot adjustment will activate when a disturbance occurs that makes the PV rise.
- Disturbance overshoot adjustment is not activated in the following situations:
- When the Disturbance Rectification Band or Disturbance Judgement Width parameter is set to 0 .
- When the SP is changed (when the SP change width exceeds the disturbance rectification band)
- During AT
- During ON/OFF control ( $\mathrm{P}=0.00$ )
- During PD control ( $I=0.00$ )
- The Disturbance Rectification Band and Disturbance Judgement Width parameters are set as percentages of FS. As such, if the input type is $\mathrm{K}(1)\left(-200.0\right.$ to $\left.1300.0^{\circ} \mathrm{C}\right)$ and you wish to set the disturbance judgement width to $15.0^{\circ} \mathrm{C}$, $15.0^{\circ} \mathrm{C} / 1500.0^{\circ} \mathrm{C} \times 100=1.00 \%$ FS
The Disturbance Judgement Width parameter is thus set to 1.00 .

| Parameter | Setting range | Unit | Default <br> value |
| :--- | :--- | :--- | :--- |
| Disturbance Overshoot <br> Adjustment Function | OFF: Disabled, <br> ON: Enabled | - | OFF |
| Disturbance Gain | -1.00 to 1.00 | - | 0.65 |
| Disturbance Time Constant | 0.01 to 99.99 | - | 1.00 |
| Disturbance Rectification <br> Band | 0.000 to 9.999 | \%FS | 0.000 |
| Disturbance Judgement <br> Width | -99.99 to 99.99 | \%FS | 0.00 |

### 5.3 Output Adjustment Functions

## MV Limits

MV Upper Limit

MV Lower Limit

- Upper and lower limits can be applied to the output of the calculated MV.
- When using ON/OFF control, the MV will be the value set for the MV Upper Limit parameter when the output is ON and the value set for the MV Lower Limit parameter when the output is OFF.
- The MV limit function does not operate when floating control is selected on a Position-proportional Control Model.
- The following MVs take precedence over the MV limit function.

Manual MV
MV at Reset
MV at PV Error

- MV Upper Limit and MV Lower Limit parameters can also be set in PID sets.

- For heating/cooling control, overall upper and lower limits are set for heating and cooling. (Separate limits cannot be set.)

| Parameter | Setting range | Unit | Default <br> value |
| :---: | :--- | :--- | :--- |
| MV Upper Limit | Standard control: <br> MV lower limit +0.1 to 105.0 | $\%$ | 100.0 |
|  | Heating/cooling control: <br> 0.0 to 105.0 | $\%$ | 100.0 |
|  | Standard control: <br> -5.0 to MV upper limit -0.1 | $\%$ | 0.0 |
|  | Heating/cooling control: <br> -105.0 to 0.0 | $\%$ | -100.0 |

## MV Change Rate Limit

MV Change Rate Limit (Heating)

MV Change Rate Limit (Cooling)

MV Change Rate Limit Mode

- The MV Change Rate Limit parameter is used to restrict the rate of change in the MV as a percentage per second (or in the opening of a valve for a Position-proportional Controller Model). If a change occurs in the MV that exceeds this setting, the MV is changed by the set limit each second until the required value is attained. When the limit is set to 0.0 , the function is disabled.
- For standard control, use the MV Change Rate Limit (Heating) parameter. The MV Change Rate Limit (Cooling) parameter cannot be used.
- For heating/cooling control, separate limits can be set for heating and cooling. The MV Change Rate Limit (Heating) parameter is used for heating and the MV Change Rate Limit (Cooling) parameter is used for cooling.
- The MV Change Rate Limit parameters cannot be used in the following conditions:
- Manual Mode
- During AT
- During ON/OFF control ( $\mathrm{P}=0.00$ )
- When control is stopped (MV Output at Stop)
- During MV Output at PV error
- If you wish only to limit the rate of increase in the MV, set the MV Change Rate Limit Mode parameter to 1.

| Parameter | Setting range | Unit | Default <br> value |
| :--- | :--- | :--- | :--- |
| MV Change Rate Limit <br> (Heating) | 0.0 to 100.0 | $\% / \mathrm{s}$ | 0.0 |
| MV Change Rate Limit <br> (Cooling) | 0.0 to 100.0 | $\% / \mathrm{s}$ | 0.0 |
| MV Change Rate Limit <br> Mode | $0:$ Increase/decrease <br> $1:$ Increase only | - | 0 |

## MV at Reset

- This parameter specifies the value of the MV when control is stopped.
In heating/cooling control, a negative value is used for the cooling MV. Thus when the MV at Reset parameter is positive, the MV will be sent to the heating output, and when negative the MV will be sent to the cooling output.
The default setting is 0.0 , which means there is no output at a reset for either standard or heating/cooling control.

| Parameter | Setting range | Unit | Default <br> value |
| :--- | :--- | :--- | :--- |
| MV at Reset | -5.0 to 105.0 <br> (Standard control) <br> -105.0 to 105.0 <br> (Heating/cooling control) | $\%$ | 0.0 |

Note: The order of priority of the MV parameter settings is Manual MV > MV at Reset > MV at PV Error.

## ■ MV at PV Error

MV at PV Error

This parameter is used to output a fixed MV when an input error, or remote SP input error occurs.
When position-proportional control is selected, the MV at PV Error parameter also functions when a potentiometer input error occurs (when the Operation at Potentiometer Input Error parameter is set to "Stop" or "Close").

When control is stopped, the setting of the MV at Reset parameter takes precedence. In Manual Mode, the manual MV takes precedence.

| Parameter | Setting range | Unit | Default <br> value |
| :--- | :--- | :--- | :--- |
| MV at PV Error for <br> Standard Control <br> Models | -5.0 to 105.0 <br> (Standard control) <br> -105.0 to 105.0 <br> (Heating/cooling control) | $\%$ | 0.0 |
| MV at PV Error <br> for Position-propor- <br> tional Control Models | $-1:$Closed output ON (Valve <br> closed) <br> $0:$ <br> No output (valve opening <br> hold) <br> Open output ON (Valve <br> open) | - | 0 |

Note: The order of priority of the MV parameter settings is Manual MV > MV at Reset > MV at PV Error.

### 5.4 Display and Key Adjustment Functions

## Display Scan

The display scan function is used to automatically change display channels on a Controller with more than one input.

This function applies only to channels that are enabled in the Number of Enabled Channels parameter. If the Number of Enabled Channels parameter is set to 3 , channels 1,2 , and 3 are displayed.

Starting/Stopping the Display Scan

The display scan can be started automatically after turning ON the power supply or by pressing the $[\mathrm{CH}$ Key.

To stop the display scan, hold down the CH Key for at least 1 second.
Use the Start Display Scan after Power ON and Display Scan Period parameters to specify how the display scan operates.

| Set values |  | Display scan status after turning ON power | Display scan control using CH Key |
| :---: | :---: | :---: | :---: |
| Start Display Scan after Power ON | Display Scan Period |  |  |
| OFF | 0 (=OFF) | Disabled | Disabled |
|  | 1 to 99 |  | Enabled |
| ON | 0 (=OFF) | Disabled | Disabled |
|  | 1 to 99 | Enabled | Enabled |

- If the PF1 Setting or PF2 Setting parameter is set to "CH" (CH Key), the PF1 or PF2 Key can be used as a CH Key. If the CH Key is not set for a function key, automatic starting of the display scan after turning ON the power is also disabled.
- When the display scan is enabled, use the CH Key to start or stop the display scan.
- To start the display scan, hold down the CH Key in the Operation Level, Program Setting Level, Adjustment Level, Adjustment 2 Level, Alarm Set Setting Level, PID Setting Level, Time Signal Setting Level, Approximation Setting Level, or Monitor Item Level. Display No. 1 will start to flash after the key is held down for 1 second, and after the key is held down for another 2 seconds, the display will stop flashing and the display scan will begin.
- If the CH Key is held down for more than 1 second during the display scan, the display scan will stop.
- During the display scan, only the $C H$ Key is enabled. To use any other keys, the display scan must first be stopped with the CH Key.
- The Channel Indicator in Manual Mode shows the manual operation display.

## - Example of Display Scan Operation

## PF Settings（Function Keys）

PF1 Setting

PF2 Setting

|  |  |
| :---: | :---: |
|  | FF\％ |
| 䨱 | Pr |
| － | 1．for |

－The［FFl and PF2 Keys serve as function keys，and the functions of these keys can be selected．

| Set values | Description | Function |
| :---: | :---: | :---: |
| OFF： | Disabled | Does not operate as a function key． |
| RUN：rion | Run | Executes run for the currently displayed channel． |
| RST：－5t | Reset | Resets the currently displayed channel． |
| P－R：r－r | Run／Reset | Executes run／reset for the currently displayed channel． |
| ARUN：Rrin | Run All | Executes run for all channels． |
| ARST： $17-52$ | Reset All | Resets for all channels． |
| HOLD：Hoid | Hold／Clear Hold | Executes and clears hold for the currently displayed channel． |
| AHON：¢H0ヵ | Hold All | Executes hold for all channels． |
| AHOF： HHaF $^{\text {a }}$ | Clear Hold All | Clears hold for all channels． |
| ADV：Pdu | Advance | Executes an advance for the currently displayed channel． |
| AADV：HRdu | Advance All | Executes an advance for all channels． |
| Bak： 口 $^{\text {P }}$ | Back | Executes a back operation for the currently displayed channel． |
| ABAK：肌 | Back All | Executes a back operation for all channels． |
| AT： 71 | AT Execute／Cancel | Starts and cancels AT execution． <br> AT is executed for the currently selected PID set． |
| A－M： 1 － | A／M Key | Starts auto／manual operation for the currently displayed chan－ nel． |
| PRG：Prim | Select Program（PRG Key） | Changes the program number（the program number is incre－ mented by 1）． |
| PFDP：prdp | Monitor／Setting Item | Displays monitor／setting items． <br> Set the Monitor／Setting Item 1 to Monitor／Setting Item 5 parameters（Advanced Function Setting Level）． |
| $\mathrm{CH}: 5 \mathrm{H}$ | CH Key | Switches channels． |

－Hold down the PFT or PF2 Key for at least 1 second to execute the function set in the PF1 Setting or PF2 Setting parameter，except for the following exceptions：The key will operate as soon as it is pressed if any of the following is set：Program，Monitor／Setting Item， or CH Key．When run or reset operations are set，the key must be pressed for at least 1 second for run，but for at least 2 seconds for reset．

## －Monitor／Setting Item

PF1 Monitor／Setting Item 1

PF2 Monitor／Setting Item 1

＊The default settings for the function keys are as follows：
PF1 Setting：，r－r（Run／Reset）
PF2 Setting：Prom（Program）
The default setting is CH Key for models with more than one input channel．
＊With the exception of the＂Select Program，＂＂Monitor／Setting Item，＂ and＂ CH Key＂settings，the function keys are effective only in the following levels：Operation，Program Setting，Adjustment， Adjustment 2，Alarm Set Setting，PID Setting，Time Signal Setting， Approximation Setting，Monitor Item，and Protect Levels．
－A key set for＂Program＂is effective only in Operation Level．
－A key set for＂Monitor／Setting Item＂is effective only in Protect Level．
－A key set for＂ CH Key＂is effective in all levels．
The keys are effective only when the PF Key Protection parameter is set to＂OFF．＂
＊Operation Adjustment Protection and Setting Change Protection do not apply to the function keys．
Parameter settings can be changed and saved using function keys if the key is set to the corresponding function．

The PF1 Setting or PF2 Setting parameter can be set to $P$ Pr （Monitor／Setting Item）to display monitor／settings using a function key．
The content to be displayed is set for each channel in the Monitor／ Setting Item 1 to Monitor／Setting Item 5 parameters of the corre－ sponding function key．

The selections are shown in the following table．Refer to the descrip－ tions of individual parameters for the setting or monitor ranges．

| Set value | Description | Remarks |  |
| :---: | :---: | :---: | :---: |
|  |  | Monitor／Setting | Display |
| OFF | Disabled |  |  |
| PVSP | PV／SP／MV | Can be set（SP） | － |
| PVDV | PV／Deviation | Monitor only | － |
| SEG．R | Remaining Segment Time | Monitor only | SEL， |
| P | Proportional Band（P） | Can be set | $P$ |
| I | Integral Time（I） | Can be set | $\square$ |
| D | Derivative Time（D） | Can be set | d |
| AL－1 | Alarm 1 | Can be set | 㫛－1 |
| AL1H | Alarm Upper Limit 1 | Can be set | P12 H |
| AL1L | Alarm Lower Limit 1 | Can be set | 婪 12 |
| AL－2 | Alarm 2 | Can be set | 呺－2 |
| AL2H | Alarm Upper Limit 2 | Can be set | H23 |
| AL2L | Alarm Lower Limit 2 | Can be set | 912！ |
| AL－3 | Alarm 3 | Can be set | P12－3 |
| AL3H | Alarm Upper Limit 3 | Can be set | 梠洲 |
| AL3L | Alarm Lower Limit 3 | Can be set | P123 |
| AL－4 | Alarm 4 | Can be set | P104 |
| AL4H | Alarm Upper Limit 4 | Can be set | 㫛里 |
| AL4L | Alarm Lower Limit 4 | Can be set | 914 |

## -Displaying the Monitor/Setting Item

To display the Monitor/Setting Item, press the function key in Operation Level, Program Setting Level, Adjustment Level, Adjustment 2 Level, Alarm Set Setting Level, PID Setting Level, Time Signal Setting Level, Approximation Setting Level, or Monitor Item Level.
Press the key repeatedly to scroll from the Monitor/Setting Item 1 to the Monitor/Setting Item 5 parameters. After the Monitor/Setting Item 5 parameter, the display changes to the first parameter in Operation Level.

* If any of settings for the Monitor/Setting Item 1 to Monitor/Setting Item 5 parameters are disabled, those settings will not appear and the display will show the next enabled setting.
* If another key is pressed during display of a Monitor/Setting Item parameter, the following will take place:
- If the Mode or Level Key is pressed, the first parameter in Operation Level will be displayed.
- If a function key set as a channel key is pressed, the channel will change and the first parameter in Operation Level of the new channel will be displayed.
- If the other function key is pressed and it is also set to Monitor/ Setting Items, the first monitor/setting item set for that key will be displayed.
- If the other function key is pressed and it is set to a function other than Monitor/Setting Items, the set function will be activated.
* Display No. 3 operates as follows while displaying Monitor/Setting Items:
- If the PV, SP, or MV is displayed, Display No. 3 monitors shows the MV.
- Otherwise, the display goes OFF.

## Other Display and Key Adjustment Functions

Other display and key adjustment functions are available. These functions are explained in Section 8 Parameters.

| Parameter | Level |
| :--- | :--- |
| Bar Graph Display Item (E5AR-T only) | Display Adjustment Level |
| Automatic Display Return Time | Display Adjustment Level |
| Display Refresh Period | Display Adjustment Level |
| Monitor Item Level Setting | Display Adjustment Level |
| PV Decimal Point Display | Initial Setting Level |

### 5.5 Protecting Settings

## Protection

- Operation

Adjustment
Protection

Operation Adjustment Protection

Protection is used to restrict access to settings in order to prevent accidental changes to the settings. The following protection can be set: Operation Adjustment Protection, Initial Setting Protection, Setting Change Protection, and PF Key Protection.

Operation Adjustment Protection restricts key operations in Operation Level, Program Setting Level, Adjustment Level, Adjustment 2 Level, Alarm Set Setting Level, PID Setting Level, Time Signal Setting Level, Approximation Setting Level, and Monitor Item Level.

| Set <br> value | PV, Fixed <br> SP, or <br> Program <br> Number | Other | Operation <br> Program <br> Setting Level, <br> Adjustment <br> Level, and <br> Adjustment 2 <br> Level | Alarm Set <br> Setting Level, <br> PID Setting <br> Level, Time <br> Signal Setting <br> Level, <br> Aproximation <br> Level and <br> Monitor Item <br> Level |
| :--- | :--- | :--- | :--- | :--- |
|  | Enabled | Enabled | Enabled | Enabled |
| 1 | Enabled | Enabled | Enabled | Prohibited |
| 2 | Enabled | Enabled | Prohibited | Prohibited |
| 3 | Enabled | Prohibited | Prohibited | Prohibited |
| 4 | Restrictions* | Prohibited | Prohibited | Prohibited |

* The Program Number parameter is prohibited.

Enabled: No restrictions (Parameters can be displayed or changed, and the level can be entered.)
Restrictions: Some restrictions apply. (Parameters can be displayed but not changed.)
Prohibited: The parameters are completely protected. (Parameters cannot be displayed and the level can be entered.)

- The default setting is 0 .

## Initial Setting Protection

## - Setting Change Protection

Setting Change Protection

Initial Setting Protection restricts access to the Input Initial Setting, Control Initial Setting, Control Initial Setting 2, Alarm Setting, Display Adjustment, and Communications Setting Levels.

| Set <br> value | Move to Input Initial <br> Setting Level | Move to Control Initial Setting, <br> Control Initial Setting 2, Alarm <br> Setting, Display Adjustment, or <br> Communications Setting Level |
| :--- | :--- | :--- |
| 0 | Enabled <br> Move to Advanced Func- <br> tion Setting Level param- <br> eter is displayed. | Enabled |
| 1 | Enabled <br> Move to Advanced Func- <br> tion Setting Level param- <br> eter is not displayed. | Enabled |
| 2 | Prohibited | Prohibited |

- When the Initial Setting Protection parameter is set to 2, nothing happens when the Level Key is held down to move to Input Initial Setting Level from Operation Level, Program Setting Level, Adjustment Level, Adjustment 2 Level, Alarm Set Setting Level, PID Setting Level, Time Signal Setting Level, Approximation Setting Level, or Monitor Item Level. (The flashing display to indicate movement to another level also does not appear.)
- The default setting is 0 .

Setting Change Protection prevents use of the 因 and Keys.

| Set <br> value | Description |
| :---: | :--- |
| OFF | Keys can be used to change settings. |
| ON | Keys cannot be used to change settings. (However, settings <br> can be changed in Protect Level.) |

- The default setting is OFF.
- PF Key Protection

PF Key Protection prevents use of the PF1/PF2 Keys.

| Set <br> value | Description |
| :---: | :--- |
| OFF | PF1/PF2 Keys are enabled. |
| ON | PF1/PF2 Keys are disabled. <br> (Prohibits use as a function key or a channel key.) |

- The default setting is OFF.

### 5.6 Alarm Adjustment Functions

## - Alarm Hysteresis

- Hysteresis can be applied when alarm outputs turn ON and OFF, as shown below.

- Alarm hysteresis can be set separately for each alarm in the Alarm 1 to 4 Hysteresis parameters.
- All default values are 0.02 (\%FS).
- A standby sequence is used to delay alarm output until the PV leaves the alarm range once and then subsequently enters it again.
- For example, for a lower-limit alarm, the PV is normally smaller than the SP when the power is turned ON and thus is within the alarm range, which would cause the alarm output to turn ON. However, if a "Lower Limit Alarm with Standby Sequence" is selected, the alarm output will not turn ON until the PV rises above the alarm set value and out of the alarm range, and then falls below the alarm value.
- Standby Sequence Reset
- The standby sequence is canceled when an alarm output occurs, and then restarts based on conditions specified in the Standby Sequence Reset parameter.
- Conditions A:

At the start of operation (including after turning ON power), When the alarm value (alarm upper or lower limit) is changed, When the input correction (Input Value 1 for Input Correction, Input Correction 1, Input Value 2 for Input Correction, or Input Correction 2 parameter) is changed,
When the SP of the current segment is changed (including changing the fixed SP in Fixed SP Mode),
When program is started (including when the program is started for program repetitions or program links), or
When the segment is changed (including when an advance is executed).

Standby Sequence Reset

- Conditions B:

When power is turned ON

- The Standby Sequence Reset parameter is used for all of Alarms 1 to 4.
- The default setting is 0 (Conditions A ).

## Alarm Latch

Alarm 1 Latch

- The alarm latch is used to make an alarm output that has turned ON remain ON until the power is turned OFF, regardless of the temperature.
- The alarm latch can be canceled by turning the power OFF or by using a communications command.
- An alarm latch can be set separately for each alarm in the Alarm 1 to 4 Latch parameters.
- The default setting is 0 (OFF).

## Close in Alarm/Open in Alarm

- When the Auxiliary Output Open in Alarm parameter is set to "Close in Alarm," the alarm output state is output as is. When it is set to "Open in Alarm," the alarm output state is inverted before being output.
- "Close in Alarm" or "Open in Alarm" can be set separately for each auxiliary output in the Auxiliary Output 1 to 10 Close in Alarm parameters.
- The default setting is $\boldsymbol{\pi} \mathbf{- 1}$ (Close in Alarm).

| Parameter setting | Auxiliary output function | Auxiliary output | Operation indicator |
| :---: | :---: | :---: | :---: |
| Close in Alarm: - | ON | ON | ON |
|  | OFF | OFF | OFF |
| Open in Alarm: - -6 | ON | OFF | ON |
|  | OFF | ON | OFF |

- The auxiliary outputs are OFF (open) while the power is turned OFF. Also, the auxiliary outputs require approximately 2 seconds after the power is turned ON before they are activated.

## Alarm SP Selection

The set point that triggers a deviation alarm during ramp operation can be set to either the present SP or the target SP.

## －Alarm Operation Summary

－The following example summarizes alarm operation．（In this example，a＂Lower Limit Alarm with Standby Sequence＂and＂Close in Alarm＂are selected）．

| Display characters | Parameter | Level <br> （Display No．3） | Use |
| :---: | :---: | :---: | :---: |
| 星上＊ | Alarm 1 to 4 Type | Alarm Setting （1．3） | Sets the alarm type． |
|  | Alarm 1 to 4 Latch | Alarm Setting （1．3） | Alarm output latch |
| 婪号＊ | Alarm 1 to 4 Hysteresis | Alarm Setting （1． $\mathbf{3}$ ） | Alarm output hysteresis |
| －ESt | Standby Sequence Reset | Alarm Setting （1． $\mathbf{3}$ ） | Sets standby sequence reset conditions． |
| 56＊n | Auxiliary Output 1 to 10 Open in Alarm | Alarm Setting （2．3） | Close in Alarm or Open in Alarm |

[^2]
### 5.7 Program Operation Functions

## ■ Rate of Rise Programming

- With rate of rise programming, the program is set using 3 element: SP, rate of rise, and time. If selecting rate of rise programming, set the Step Time/Rate of Rise Programming parameter to "Rate of Rise Programming."
- The Segment Time parameter can be set to between 0.00 and 99.59 (hours.minutes or minutes.seconds) or between 0.00.0 and 99.59.9 (minutes.seconds.tenths of seconds). The default is 0.00 or 0.00 .0 .
- The Time Unit of Ramp Rate parameter can be set to 10 hours, hours, minutes, or seconds. The default is minutes.
- If the Segment Rate of Rise parameter is set to 0 , the ramp segment is skipped and the soak segment is continued.
- In ramp segments, the SP of the previous segment is used as the starting point and the rate of rise for the current segment is continued in a straight line. The point reached when the time for the current segment has passed then becomes the present SP.

Operation at Reset Parameter Set to Stop Control

Ramp settings are for even-numbered segments by setting the SP and rate of rise.

- The following table shows an example setting. The Time Unit of Ramp Rate parameter is set to "Time."

| Segment No. | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ | $\mathbf{~}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Segment Set <br> Point | 30.0 | 100.0 | --- | 200.0 | --- | 150.0 | $\boldsymbol{\cdots}$ |
| Segment Rate of <br> Rise | --- | 7.0 | --- | 5.0 | --- | 5.0 | $\boldsymbol{\cdots}$ |
| Segment Time <br> (hours:minutes) | $6: 00$ | --- | $0: 00$ | --- | $14: 00$ | --- | $\boldsymbol{\cdots}$ |

- For the E5AR-T/ER-T, Step Time programming is used for segment 1. The rate of rise programming can be selected to start from the segment 1 SP or from a PV start with slope priority.
- With rate of rise programming, the settings are made in blocks of two segments, so the final soak time cannot be set if the Number of Segments Used parameter is set to an even number. Therefore, the final segment will be a soak segment if the Number of Segments Used parameter is set to an odd number and will be a ramp segment if set to an even number.
- Operation at Reset Parameter Set to Use Fixed Control

Ramp settings are made for odd-numbered segments by setting the SP and rate of rise.

- The following table shows a setting example. The Time Unit of Ramp Rate parameter is set to "Time."

| Segment No. | 1 | 2 | 3 | 4 | 5 | - |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Segment Set Point | 100.0 | --- | 200.0 | --- | 150.0 | -•• |
| Segment Rate of Rise | 7.0 | --- | 5.0 | --- | 5.0 | - . |
| Segment Time (hours:minutes) | --- | 0:00 | --- | 14:00 | --- | - . |

- With rate of rise programming, the settings are made in blocks of two segments, so the final soak time cannot be set if the Number of Segments Used parameter is set to an odd number. Therefore, the final segment will be a soak segment if the Number of Segments Used parameter is set to an even number and will be a ramp segment if set to an odd number.

If the rate of rise setting is changed in the middle of a segment, the segment time for the ramp period changes as well as the rate of rise for the present SP.

- In the above diagram, the increased rate of rise results in a shorter time for that segment.
- Similarly, if the SP is changed, the segment time for the ramp period is also changed.
- If the soak time is changed, only the segment time for the soak period is changed.

Program Operations
This section describes the parameters used during program operation.

- An advance operation moves to the start of the next segment.
- An advance operation moves forward to the end of the present segment each time the Advance parameter is set to "ON." The Advance parameter turns OFF once the next segment has been reached.
- An advance operation cannot be executed during reset.
- A hold operation forces the program to maintain steady-state control at the segment set point.
- The timer is stopped when the Hold parameter is set to "ON" and restarts when the Hold parameter is set to "OFF."
- The hold is cleared under the following conditions: The Hold parameter is set to "OFF" (the program continues from the segment set point), the Run/Reset parameter is set to "Reset," or the program operation is completed as a result of an advance operation being executed.
- If an advance operation is executed during a hold, the hold is continued from the beginning of the next segment.
- The Hold parameter cannot be executed while resetting.

## - Back

- Program Repetitions

## - Program Links

- A back operation resets the segment timer and returns to the beginning of the current segment.
- If a back operation is executed during a hold, the hold is continued from the beginning of the current segment.
- A program repetition restarts execution of the same program automatically after the end of the current program. The Program Repetitions parameter can be set up to 9,999.
- The number of executions will be the setting for the Program Repetitions parameter +1 .
- If the Program Repetitions parameter is changed to a smaller number during program operation, the currently executing program will be executed to the end and then the program will stop.
- A program link moves execution to segment 1 of the program number set for Program Link Destination parameter. Operation will be completed when the Program Link Destination parameter is set to program 0.
- If a program repeat operation is also set, the program link will start after the program repeat operation has been completed.
- If the Program Link Destination parameter is set to the current program number, the program will be repeated endlessly.
- Once all programs have been executed, operation will be according to the setting for the End Condition parameter.

## SP Modes

## - Switching SP Modes

The E5AR-T/ER-T uses three SP modes: Program SP (PSP), Fixed SP (FSP), and Remote SP (RSP).

- The diagram on the right shows an example of switching between Program SP Mode and Fixed SP Mode during program execution.

The operation is as follows:
(1) Switch from Program SP to Fixed SP in segment N .
(2) The mode changes to Fixed SP.
(3) Return to Program SP from Fixed SP in segment $\mathrm{N}+1$.

- If the Operation at Reset parameter is set to stop control, the timer will not start
 when the Run/Reset parameter is changed to "Run" in Fixed SP or Remote SP Mode.
- When the SP Tracking parameter is set to "ON," the program SP is held after the mode is changed from Program SP to Fixed SP and until the Fixed SP is changed. The SP is not tracked when the mode is changed from another mode into either Program SP or Remote SP.
- The diagram on the right shows SP tracking when the mode is changed from Program SP to Fixed SP.

Without SP tracking

## Wait

- If at the end of a program segment the difference (deviation) between the PV and the present set point (program SP) is not within a preset range, the program can be set to not continue. This is called the "wait" operation and the preset range is called the "wait band."
- If the PV enters the wait band during wait operation, the program will immediately move to the next segment.
- There are two types of wait operation: "Wait at Segment End" and "Always wait," which can be selected by setting the Wait Mode parameter. The wait operation can be enabled and disabled for each segment.
- Upper and lower limits can be set for the wait band and these can be set for each program. The wait operation will be disabled if the Wait Band parameter is set to 0 .

## - Wait at Segment End

If the difference (deviation) between the PV and the present SP is not less than the wait band, the program does not move to the next segment. As soon as the PV enters the wait band, the program moves to the next segment.

The difference (deviation) between the PV and the present set point are constantly compared during program operation. If the PV is not within the wait band, the present set point is held at the point that the deviation went outside the wait band and the program does not move on. The program moves on as soon as the PV enters the wait band.

- One out of following functions can be selected: Segment Output, Time Signal, or Segment No. Output (described later).
- When the Time Signal parameter is enabled, 6 outputs can be set for each program and three different times can be set for each output.
- There are two timers for the time signal: a switch-ON timer and a switch-OFF timer. The timers start from the beginning of the segment.
- Outputs turn ON once the switch-ON time has elapsed and turn OFF after the switch-OFF time has elapsed.

## Time Signal

- The Time Signal 1 Set Segment 1 to Time Signal 6 Set Segment 3 parameters are used to set the segments in which the time signals will start. The default setting is 0 (disabled).
- The ON/OFF timing is set using the Time Signal 1 ON Time 1 to Time Signal 6 ON Time 3 and Time Signal 1 OFF Time 1 to Time Signal 6 OFF Time 3 parameters. The default setting is 0.00 or 0.00.0.
- Set the interval between the switch-ON time and switch-OFF time to at least 100 ms . Unexpected operation may result if the interval is less than 100 ms .
- ON Conditions
- If the switch-OFF time is shorter than the switch-ON time, the output remains ON from when the switch-ON time has elapsed until reset or the next program starts.
- If an advance operation is executed during a segment where a time signal is set, a time equivalent to the segment will be considered to have elapsed. In the above diagram, for example, outputs remain ON from the start of the next segment until the switch-OFF time has elapsed.
- The time signal is turned OFF under the following conditions:
- During a reset
- When one program has been completed when a program repeat or program link operation has been set.
- The time signal timer stops during hold, wait, and AT operations.

## Segment Outputs

- One of following functions can be selected: Segment Output, Time Signal, or Segment No. Output (described later).
- Up to 10 outputs can be set for each program if using segment outputs is selected.
- Segment outputs can be set to ON or OFF for each segment. Outputs are turned ON if the Segment Output parameter for that segment is set to ON .

- Segment outputs are turned OFF during a reset.

## Program Status Outputs

The following two types of program status outputs can be used.

- Program End Output: Output at the end of the program.
- Segment No. Output: The number of the segment for which the program is being executed is output.
- The program end output occurs at the end of the last segment.
- The program end output occurs at the end of the last segment of the last program if a program repeat or program link operation is set.
- The pulse width for the program end output can be set using the Program
 End ON Time parameter. The setting range for the Program End ON Time parameter is 0.0 to 10.0 s . The default setting is 0.0 .
- The program end output is forced OFF if the Run/Reset parameter is changed to "Run" during a reset.
- If the Program End ON Time parameter is set to "ON," the output also remains ON during reset status, i.e., until the Run/Reset parameter changes to "Run."

Segment No. Output

- One out of following functions can be selected: Segment No. Output, Time Signal, or Segment Output.
- The number of the segment for which the program is currently being executed is output in binary-coded hexadecimal.

- All outputs turn OFF during reset.

## Operation at Program Start

## - PV Start

Start with Slope
Priority

- The method for starting program operation can be selected from the following using the PV Start parameter: SP start, PV start with slope priority or PV start with time priority. A PV start with time priority cannot be selected, however, if rate of rise programming is set.
- A PV start is used only for the first program execution if a program repeat or program link operation is set.

SP Start A SP start is used to execute the program in order from the segment 1 SP.
If the Operation at Reset parameter is set to "Fixed Control," then the program will start operation from the fixed SP.

Operation is started from the position of the first present set point that matches the PV at the start of the program. If the PV and the present set point do not match at any
 position, operation starts at the beginning of the program. The above diagram shows an example of the operation. The first position where the PV and the present SP match is in segment 4 and from there the program is indicated by a bold line. The program prior to that position is ignored.
PV Start with Time The SP at the start of the program is set to the current PV and the Priority ramp rate is modified accordingly to adjust to the segment time. This means that, in general, the segment 2 ramp rate will change from the rate that is set in the program.

The following diagram shows operation examples when the PV at the start of program operation is larger than the SP and when it is smaller than the SP. Once segment 2 has been completed, the operation is according to the program. Using a PV Start with time priority is disabled if rate of rise programming is used.

- When a standby is set, the program does not start operating until the standby time (set in hours:minutes) has elapsed after the Run/Reset parameter is set to "Run."
- The following conditions apply to operation during a standby:
- Control outputs are governed by the MV at Reset parameter (the indicators and status display will show Run status).
If the Operation at Reset parameter is set to "Fixed Control," then control outputs will start from the fixed SP.
- Hold, advance, back, and AT operations (when the Operation at Reset parameter is set to "Stop Control") cannot be executed. If AT is executed when the Operation at Reset parameter is set to "Fixed Control," the remaining standby time during AT execution is held.
- If the power is interrupted during a standby, the remaining standby time is held (if the Operation at Power ON parameter is set to "Continue," if the program is running and in Manual Mode before the power was turned OFF, and if a ramp back is set.
- If run operation is executed in reset status, the remaining standby time is set as the value for the Standby Time parameter. This means the remaining standby time is continued when run operation is executed during a standby (the set value for the Standby Time parameter is not initialized).

The End Condition parameter is used to select the operation after a program has been completed can be selected. The options are Reset Status, Continue, or Fixed SP Mode.

| Operating <br> status | $\quad$ Description |
| :--- | :--- |
| Reset status | Ends operation. |
| Continue | Control is continued using the SP of the last segment. <br> The final segment number is held as the segment number <br> and the elapsed program time, elapsed segment time, and <br> remaining segment time are held. <br> The time signal status at the end of operation is held. <br> If the setting of the Number of Segments Used parameter is <br> changed after operation has completed, there is no change to <br> the operation end status but control will switch to using the <br> SP of the last segment after the change. |
| Fixed SP <br> ModeOperation is continued in Fixed SP Mode after the program <br> has completed (run status). <br> The segment number, elapsed program time, elapsed seg- <br> ment time, and remaining segment time will be the values <br> from the start of the program. <br> The time signal is OFF. <br> If the SP Mode parameter is changed to Program SP (PSP), <br> the program will start again. <br> If, however, the Operation at Reset parameter is set to "Fixed <br> Control," Fixed SP Mode cannot be set. |  |

### 5.8 Using Event Inputs

- An order of priority exists for event inputs, key operation, and communications settings: The last setting takes priority.
- The operation of event inputs can be switched between pulse operation (i.e., event occurs only when the input changes from OFF to ON ) and toggle operation (i.e., event occurs either when the input changes from OFF to ON or from ON to OFF).

## Event Input Assignments

Event Input 1 Assignment

- Functions are assigned to event inputs (which use external contact inputs) using the Event Input Assignment 1 to 6 parameters.
- On a Controller with more than one input, functions can be assigned for channels 2 and higher for the number of supported channels.

- When the event input is ON, parameters can be written using communications.
- The Communications Write OFF/ON function creates an operation command that applies to all channels.
- Operation is as described below based on the ON/OFF status of the event input.

## - Program Number

| Event input | Description |
| :---: | :---: |
|  | Communications Writing OFF |
|  | Communications Writing ON |

- The program number can be specified using the ON/OFF status of event inputs.
- This program number function creates an operation command that applies to all channels for coordinated operation and one specific channel for independent control.
- This function is enabled only during a reset.
- The following table shows the operation based on the ON/OFF status of event inputs.

| Bit 0, Weight 1 | Bit 1 Weight 2 | Bit 2 <br> Weight 4 | Bit 3 <br> Weight 8 | Bit 4 <br> Weight 16 | Bit 5 <br> Weight 32 | Bit 0 Weight 10 | Bit 1 Weight 20 | Code | Program number |

| ON | OFF | ON | OFF | --- | --- | ON | OFF |  | 15 |
| OFF | ON | ON | OFF | --- | --- | ON | OFF |  | 16 |
| ON | ON | ON | OFF | --- | --- | ON | OFF |  | 17 |
| OFF | OFF | OFF | ON | --- | --- | ON | OFF |  | 18 |
| ON | OFF | OFF | ON | --- | --- | ON | OFF |  | 19 |
| OFF | OFF | OFF | OFF | --- | --- | OFF | ON |  | 20 |
| ON | OFF | OFF | OFF | --- | --- | OFF | ON |  | 21 |
| OFF | ON | OFF | OFF | --- | --- | OFF | ON |  | 22 |
| ON | ON | OFF | OFF | --- | --- | OFF | ON |  | 23 |
| OFF | OFF | ON | OFF | --- | --- | OFF | ON |  | 24 |
| ON | OFF | ON | OFF | --- | --- | OFF | ON |  | 25 |
| OFF | ON | ON | OFF | --- | --- | OFF | ON |  | 26 |
| ON | ON | ON | OFF | --- | --- | OFF | ON |  | 27 |
| OFF | OFF | OFF | ON | --- | --- | OFF | ON |  | 28 |
| ON | OFF | OFF | ON | --- | --- | OFF | ON |  | 29 |
| OFF | OFF | OFF | OFF | --- | --- | ON | ON |  | 30 |
| ON | OFF | OFF | OFF | --- | --- | ON | ON |  | 31 |
| OFF | ON | OFF | OFF | --- | --- | ON | ON |  | 32 |

- The program number switches when the input changes from OFF to ON or ON to OFF.
- For binary coded hexadecimal (BCH), Program No. (Bit 0 Weight 1) to Program No. (Bit 5 Weight 32) are used. For binary coded decimal (BCD) Program No. (Bit 0 Weight 1) to Program No. (Bit 3 Weight 8) and Program No. (Bit 0 Weight 10) to Program No. (Bit 1 Weight 20) are used.
- Inputs without program number allocations are treated as OFF.
- If the program number is 0 or 33 or higher, the program number in EEPROM will be used.

## - Run (ON)/ Reset (OFF)

## - Run (OFF)/

Reset (ON)

Auto (OFF)/ Manual (ON)

- When the event input is ON, operation is performed and the Run/ Reset parameter is set to "Run."
- This Run (ON)/Reset (OFF) function creates an operation command that applies to one specific channel.
- Operation is as follows based on the ON/OFF status of the event input:

| Event input | Description |
| :---: | :---: |
|  | Reset |
|  | Run (program operation) |

- When the event input is ON, the Run/Reset parameter is set to "Reset."
- This Run (OFF)/Reset (ON) function creates an operation command that applies to all channels for coordinated operation and one specific channel for independent control.
- Operation is as follows based on the ON/OFF status of the event input:

| Event input | Description |
| :---: | :---: |
| - | Run (program operation) |
|  | Reset |

- When the event input is ON, the mode switches to Manual Mode.
- The Auto (OFF)/Manual (ON) function creates an operation command that applies to one specific channel.
- Operation is as follows based on the ON/OFF status of the event input:

| Event input | Description |
| :---: | :---: |
|  | Auto |
|  |  |

- Program SP (OFF)/ Remote SP (ON)
- This function is valid only when using control with a remote SP.
- When the event input is ON, the remote SP (RSP) is used as the SP. When the event input is OFF, the program SP (PSP) is used as the SP.
- The Program SP (OFF)/Remote SP (ON) function creates an operation command that applies to one specific channel.
- Operation is as follows based on the ON/OFF status of the event input:

| Event input | Description |
| :---: | :---: |
|  | Program SP Mode |
|  |  |

- Remote SP (OFF)/ Fixed SP (ON)
- When the event input is ON, the fixed SP (FSP) is used as the SP. When the event input is OFF, the remote SP (RSP) is used as the SP.
- The Remote SP (OFF)/Fixed SP (ON) function creates an operation command that applies to one specific channel. This function is disabled, however, for channels that do not support the remote SP function.
- Operation is as follows based on the ON/OFF status of the event input:

| Event input | Description |
| :---: | :---: |
|  | Remote SP Mode |
|  |  |

## - Program SP (OFF)/

 Fixed SP (ON)
## - Program SP

## - Remote SP

- When the event input is ON, the fixed SP (FSP) is used as the SP. When the event input is OFF, the program SP (PSP) is used as the SP.
- The Program SP (OFF)/Fixed SP (ON) function creates an operation command that applies to one specific channel. This function is disabled, however, for channels 2 to 4 during coordinated operation.
- Operation is as follows based on the ON/OFF status of the event input:

| Event input | Description |
| :---: | :---: |
|  | Program SP Mode |
|  | Fixed SP Mode |

- When the event input is ON, the program SP (PSP) is used as the SP. The event input must be reset before this function can be activated again.
- The Program SP function creates an operation command that applies to one specific channel. This function is disabled, however, for channels 2 to 4 during coordinated operation.
- Operation is as follows based on the ON/OFF status of the event input:

| Event input | Description |
| :---: | :---: |
|  | Program SP Mode |

- When the event input is ON, the remote SP (RSP) is used as the SP. The event input must be reset before this function can be activated again.
- The Remote SP function creates an operation command that applies to one specific channel. This function is disabled, however, for channels that do not support the remote SP function.
- Operation is as follows based on the ON/OFF status of the event input:

| Event input | Description |
| :---: | :---: |
| $\square$ | Remote SP Mode |
|  |  |

## - Fixed SP

## - Hold (ON)/Clear Hold (OFF)

- When the event input is ON, the fixed SP (FSP) is used as the SP. The event input must be reset before this function can be activated again.
- The Fixed SP function creates an operation command that applies to one specific channel.
- Operation is as follows based on the ON/OFF status of the event input:

| Event input | Description |
| :---: | :---: |
|  | Fixed SP Mode |

- When the event input is ON, the program is on hold and this status is held until the event input changes to OFF.
- The Hold (ON)/Clear Hold (OFF) function creates an operation command that applies to one specific channel. During coordinated operation, however, the operation command applies to all channels.
- This function is enabled only during program operation.
- Operation is as follows based on the ON/OFF status of the event input:

| Event input | Description |
| :---: | :---: |
|  | Clear Hold Mode |
|  |  |

- When the event input is ON, the segment is advanced to the beginning of the next segment. The event input must be reset before this function can be activated again.
- The advance function creates an operation command that applies to one specific channel. During coordinated operation, however, the operation command applies to all channels.
- This function is enabled only during program operation.
- Operation is as follows based on the ON/OFF status of the event input:

| Event input | Description |
| :---: | :---: |
|  | Advance Mode |

- When the event input is ON, the program returns to the start of the current segment being executed. The event input must turn OFF once before this function can be used again.
- The back function creates an operation command that applies to one specific channel. During coordinated operation, however, the operation command applies to all channels.
- This function is enabled only during program operation.
- Operation is as follows based on the ON/OFF status of the event input:

| Event input | Description |
| :---: | :---: |
|  | Back Mode |

| Display characters | Parameter names | Level <br> (Display No. 3) | Use |
| :---: | :---: | :---: | :---: |
| Eu. * | Event Input 1 to 10 Assignment | Control Initial Setting 2 Level (1.2) | Event input specification |

### 5.9 Using a Transfer Output

## Transfer Output Settings

- For a transfer output, use an output that is not being used as a control output.
- Control/Transfer

Output
Assignments

- A transfer output can be used to output one of the following five types of data as selected in the Control/Transfer Output Assignment parameters.
(1) Present Set Point
(2) Present Value (PV)
(3) MV (Heating)
(4) MV (Cooling)
(5) Valve Opening

For more information, refer to 8.13 Control Initial Setting 2 Level ( $1 . \mathbf{E}^{7}$ ) Control/Transfer Output 1 to 4 Assignments (P. 8-64).

The heating and cooling MVs can be output only from a Standard Control Model, and the valve opening can be output only from a Position-proportional Control Model with a potentiometer connected.

## - Transfer Output Scaling

- Scaling of the output value can be performed using Transfer Output Upper Limit and Transfer Output Lower Limit parameters. The upperlimit can be set to a smaller value than the lower limit to perform reverse scaling. The scale can be enlarged using the width between the upper and lower limits specified in the parameters. The following diagram shows an example of scaling the heating MV.

- If the Input Type, Scaling Input Value 1 or 2, SP Upper and Lower Limit, or Temperature Unit parameter is changed, the Transfer Output Upper Limit and Transfer Output Lower Limit parameters will be returned to the upper and lower limits of the setting range.
- If an input error occurs when the transfer output assignment is set to "PV," the transfer output changes to the upper limit and it changes to the lower limit for reverse scaling.

$\nabla$ Upper and lower limits
- Upper and lower limits of transfer scaling

| Display | Parameter | Level <br> (Display No. 3) | Use |
| :---: | :---: | :---: | :---: |
| abit.* | Control/Transfer Output 1 to 4 Assignment | Control Initial <br> Setting 2 (L. . $\mathbf{Z}^{\prime}$ ) | Specify Control/ Transfer Output |
| ErH. * tri.* | Transfer Output 1 to 4 Upper Limit and Transfer Output 1 to 4 Lower Limit | Control Initial <br> Setting 2 ( $\mathbf{L}, \mathbf{C l}^{2}$ ) | Transfer Output Scaling |

*: 1 to 4

### 5.10 Using Communications

## Setting Communications Parameters

Communications parameters are set in the Communications Setting Level. The parameters and settings are listed in the following table.

| Display | Parameter | Set values | Description |
| :---: | :---: | :---: | :---: |
| PSE! | Protocol Selection | [uF /nad | CompoWay/F or Modbus |
| - H-na | Communications Unit No. | 0, 1 to 99 | 0 to 99 |
| 695 | Communications Speed | $9.6 / 19.2 / 38.4$ | 9.6, 19.2, or 38.4 (kbits/s) |
| UEn | Communications Data Length | $7 / 8$ (bit) | 7/8 (bits) |
| Sbit | Communications Stop Bit | 1/2 | 1/2 (bits) |
| Prey | Communications Parity | none/ EuEn /add | None, even, or odd |
| 562t | Transmission Wait Time | 0 to 20 to 99 | 0 to 99 (ms) |

* Default settings are highlighted.

## - Parameter <br> Descriptions

Protocol Selection (PSEL)
The communications protocol can be set to CompoWay/F (OMRON'S unified protocol for general-purpose serial communications), or Modbus (based on RTU Mode of Modbus Protocol (specifications: PI-MBUS-300 Rev.I) of Modicon Inc.).
Communications Unit No. ( $\vdots-n-\bar{O})$
When performing communications with a host computer, a unit number must be set for each Controller to allow the host computer to recognize it. Any number from 0 to 99 can be set. The unit number is set to 1 by default. When using multiple Controllers, make sure that no Controllers have the same unit number or communications will not take place correctly. After setting a unit number, turn OFF the power and then turn it ON again to enable the new unit number.

## Communications Speed ( CP )

Set the baud rate for communications with a host computer. The following speeds are possible: 9.6 ( $9,600 \mathrm{bit} / \mathrm{s}$ ), 19.2 ( $19,200 \mathrm{bit} / \mathrm{s}$ ), or 38.4 ( $38,400 \mathrm{bit} / \mathrm{s}$ )

After setting the baud rate, turn OFF the power and then turn it ON again to enable the new baud rate.

## Communications Data Length (2En)

The communications data length can be set to 7 bits or 8 bits.
Communications Stop Bit (5bLt)
The number of communications stop bits can be set to 1 or 2 bits.

## Communications Parity ( $\because$ にG)

The communications parity can be set to none ( $\boldsymbol{n} \boldsymbol{m} \boldsymbol{E}$ ), even (EuEn), or odd (adid).

## Transmission Wait Time (5blle)

After changing the transmission wait time, perform a software reset or turn the power OFF and then ON to enable the new setting.

Configure communication setting data in accordance with the other computers

For information on communications procedures, refer to Section 6 CompoWay/F Communications (P. 6-1) or Section 7 Modbus Communications (P. 7-1) depending on the communications protocol you are using.

Before performing communications, perform the following steps to set the communications unit number, communications speed, and other communications parameters.

1. Hold down theKey for 3 seconds to move from the Operation Level to the Input Initial Setting Level.
2. Press the $\square$ Key to move from the Input Initial Setting Level to the Communications Setting Level.
3. Press the Key to scroll through the setting items as shown at left.
4. Press the and $\approx$ Keys to change a setting.

## Communications Writing

To allow a host computer to write parameters to a Controller, set the Communications Writing parameter (Adjustment Level) to än (Enabled).

## - Procedure

1. Press the $\square$ Key for less than 1 second to move from the Operation Level to the Adjustment Level.
2. Press the Key to set the Communications Writing parameter to an.
[^3]
## Section 6 CompoWay/F Communications

6.1 Communications Method ..... 6-2

### 6.1 Communications Method

## CompoWay/F Communications

CompoWay/F is an OMRON protocol for general-purpose serial communications. CompoWay/F features a unified frame format and FINS-compliant commands, which have a long record of successful use with OMRON Programmable Controllers. CompoWay/F simplifies communications between multiple components and between components and a computer.

FINS (Factory Interface Network Service)
FINS is a protocol for message communications between Controllers on an OMRON factory automation network.

## Supplement

Communications are implemented by creating a program on the host computer. The descriptions in this section are therefore from the perspective of the host computer. For example, "reading" and "writing" refer to the host computer reading from and writing to the E5AR-T/ERT.

Communications Specifications

| Transfer connection | Multi-point |
| :--- | :--- |
| Communications method | RS-485 (2-wire, half duplex) |
| Synchronization method | Start-stop |
| Baud rate | $9.6,19.2$, or 38.4 Kbits/s |
| Send code | ASCII |
| Data length | 7 or 8 bits |
| Stop bit length | 1 or 2 bits |
| Error detection | Vertical parity: None, even, or odd <br> BCC (Block Check Character) |
| Flow control | None |
| Interface | RS-485 |
| Retry function | None |
| Communications buffer | 217 bytes |
| Communications <br> response send wait time | 0 to 99 ms <br> Default: 20 ms |

Note: Default settings are shaded.

Transfer Protocol
The host computer sends a command frame, and the E5AR-T/ER-T returns a response frame based on the contents of the command frame. One response frame is sent in response to one command frame.

The exchange of the command frame and response frame is described below.

After receiving a response from the Controller, have the host computer wait at least 5 ms before sending the next command.
When writing multiple sets of parameters in a row, such as when writing to the variable area or performing a compound write, control characteristics may be affected. Observe the following points.

### 6.2 Frames

Commands from the host computer and responses from the E5AR-T/ER-T take the form of frames that conform to the CompoWay/F protocol. The data included in command frames and response frames is described in this section.
In the following descriptions, an " H " following a numeric value (for example 02 H ) indicates that the value is a hexadecimal number. Numbers or letters enclosed in quotation marks (for example " 00 ") are ASCII data.

## Command Frames

| STX | A code that indicates the beginning of a communi- <br> cations frame (02H). Be sure to set this code in the <br> leading byte. |
| :---: | :--- |
| Node No. | The node number specifies the destination. <br> Specify the unit number of the E5AR-T/ER-T. <br> When broadcasting to all nodes, specify "XX." <br> Responses are not returned for broadcasts. |
| Sub-address | Not used on the E5AR-T/ER-T. Always set to "00." |$|$| SID <br> (Service ID) | Not used on the E5AR-T/ER-T. Always set to 0. |
| :---: | :---: |
| FINS-mini <br> command text | The text of the command. |
| ETX | A code that indicates the end of the text (03H). |
| BCC | Block Check Character <br> This byte stores the result of the BCC calculation <br> from the node number through EXT. |

| STX | Node No. | -address | SID | FINS-mini command text | ETX BCC |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 02H | $3 \mathrm{OH}, 3 \mathrm{H}$ | $30 \mathrm{H}, 3 \mathrm{H}$ | 30 H | $30 \mathrm{H}, 35 \mathrm{H}, 30 \mathrm{H}, 3 \mathrm{H}$ | 03H | 36 H |

$\mathrm{BCC}=30 \mathrm{H} \oplus 30 \mathrm{H} \oplus 30 \mathrm{H} \oplus 30 \mathrm{H} \oplus 30 \mathrm{H} \oplus 30 \mathrm{H} \oplus 35 \mathrm{H} \oplus 30 \mathrm{H} \oplus 30 \mathrm{H} \oplus 03 \mathrm{H}=36 \mathrm{H}$
$\oplus$ : XOR (exclusive OR) operation

## Response Frames

| STX | A code that indicates the beginning of the commu- <br> nications frame (02H). This code is always set in <br> the leading byte. |
| :---: | :--- |
| Node No. | The unit number that was specified in the com- <br> mand frame is returned here. This is the unit num- <br> ber of the responding E5AR-T/ER-T. |
| Sub-address | Not used on the E5AR-T/ER-T. Always set to "00." |
| End code | Returns the result of execution for the command <br> frame. |
| FINS-mini <br> response text | Text of the response. |
| ETX | A code that indicates the end of the text (03H). |
| BCC | Block Check Character <br> This byte stores the result of the BCC calculation <br> from the node number through EXT. |

- End Codes

| End <br> code | Name | Meaning | Error <br> detection <br> priority |
| :---: | :--- | :--- | :---: |
| "0F" | FINS command error | Could not execute the specified FINS command. | 8 |
| "10" | Parity error | Sum of bits that are "1" in received data does not agree with the <br> communications parity. | 2 |
| $" 11 "$ | Framing error | Stop bit of command frame characters is 0. | 1 |
| $" 12 "$ | Overrun error | Attempted to transfer new data when reception data buffer is <br> already full. | 3 |
| $" 13 "$ | BCC error | Calculated BCC is different from received BCC. | 5 |
| "14" | Format error | Characters other than "0" to "9" or "A" to "F" are contained in <br> the FINS-mini Command Text or, for Echoback Test, data other <br> than the test data was returned. <br> No SID and FINS-mini Command Text, or no FINS-mini Com- <br> mand Text. <br> MRC/SRC are not correct in FINS-mini Command Text. | 7 |
| "16" | Sub-address error | No sub-address, SID, or FINS-mini Command Text; or <br> sub-address is less than 2 characters and no SID and FINS- <br> mini Command Text. | 6 |
| $" 18 "$ | Frame length error | The command frame exceeds the specified number of bytes. | 4 |
| "00" | Normal end | Command was executed normally without error. | None |

## Supplement

A response is not sent to command frames that do not end with the ETX.BCC characters.

### 6.3 FINS-mini Text

The FINS-mini Command Text and FINS-mini Response Text form the body of command/response communications. FINS-mini Command Text and FINS-mini Response Text are set as described in this section.

## - Command Text

- Response Text

FINS-mini Command Text consists of a main request code (MRC) and a sub-request code (SRC), followed by the required data.

FINS-mini Response Text consists of the MRC and SRC, followed by a main response code (MRES) and sub-response code (SRES), and then the required data.

If the specified FINS-mini command was not successfully executed, the response will contain only the MRC, SRC, MRES and SRES.

## - List of FINS-mini Commands for CompoWay/F

| MRC | SRC | Command name | Description |
| :--- | :--- | :--- | :--- |
| $" 01 "$ | "01" | Read from Variable Area | Reads monitor values or set values. |
| $" 01 "$ | "02" | Write to Variable Area | Writes set values. |
| $" 01 "$ | "04" | Composite Read from Variable Area | Reads multiple monitor values or set values. |
| $" 01 "$ | $" 13 "$ | Composite Write to Variable Area | Writes multiple set values. |
| "01" | $" 10 "$ | Composite Registration Read | Reads in order the contents of addresses speci- <br> fied for the Composite Read Registration com- <br> mand. |
| "01" | $" 11 "$ | Composite Read Registration | Specifies the addresses to be read for the Com- <br> posite Read from Variable Area command. |
| $" 01 "$ | $" 12 "$ | Composite Read Registration Confirmation | Reads the contents of the registration for the <br> Composite Read from Variable Area command. |
| $" 05 "$ | "03" | Controller Attribute Read | Reads the model. |
| $" 06 "$ | $" 01 "$ | Controller Status Read | Reads the operating status. |
| $" 08 "$ | $" 01 "$ | Echoback Test | Performs an echoback test. |
| $" 30 "$ | $" 05 "$ | Operation Commands | Executes operation commands, such as Run/ <br> Reset, AT Execute/Cancel, and Move to Setting <br> Area 1. |

### 6.4 Variable Areas

The areas used for data exchange when communicating with the E5AR-T/ER-T are called the variable areas. Present values can be read, and set values can be read and written using the variable areas of the E5AR-T/ER-T.

Operation commands and reading Controller attributes do not use the variable areas.

A variable areas is accessed by specifying the position of a variable within a variable area using the variable type and address.

Variable Types
The following table lists the variable types in the variable area.

| Variable <br> type | Description | Area |
| :---: | :--- | :---: |
| C4 | Communications Monitor |  |
| C5 | Protect Level |  |
| C6 | Operation Level |  |
| C7 | Adjustment Level | Setting area 0 <br> (Operation in <br> progress.) |
| C8 | Adjustment 2 Level |  |
| C9 | Alarm Set Setting Level |  |
| CA | PID Setting Level |  |
| CB | Approximation Setting Level |  |
| D8 | Program Setting Level |  |
| D9 | Time Signal Setting Level |  |
| CC | Input Initial Setting Level |  |
| CD | Control Initial Setting Level |  |
| CE | Control Initial Setting 2 Level |  |
| CF | Alarm Setting Level | Setting area 1 <br> (Operation stopped.) |
| D0 | Display Adjustment Level |  |
| D1 | Communications Setting Level |  |
| D2 | Advanced Function Setting Level |  |
| D3 | Expansion Control Setting Level |  |

## Addresses

Addresses are allocated within each variable type. Addresses are two bytes long and written in hexadecimal. Addresses are allocated according to access size. Each address consists of a channel identifier and the address in the area.

Address (2 bytes)

Channel
Address in area 00 to 7 F :
identifier (0 to 3) 128 variables

* Bits other than those for the channel identifier and the address in the area are used for variable types DA to F9.

## - Channel Identifier

## - Address in Area

## ■ Number of Elements

The number of elements is expressed as a 2-byte hexadecimal number. For example, if the number of elements is 0010 , the first 16 elements of data ( $\mathrm{H}^{\prime} 10$ ) from the address are specified.

The specification range for the number of elements depends on the command. Refer to 6.9 Commands and Responses (P. 6-17) for more information.

## Set Values

Values read and written to a variable area are expressed in hexadecimal and disregard the decimal point. Negative values are expressed as a two's complements.
Example: D'105.0 $\rightarrow \mathrm{H}^{\prime} 0000041 \mathrm{~A}$
This variable is an 8-digit number in hexadecimal. Negative values are expressed as a two's complement. The decimal is disregarded. If the PV of the E5AR-T/ER-T is 105.0 , it will be read as $\mathrm{H}^{\prime} 0000041 \mathrm{~A}\left(105.0 \rightarrow 1050 \rightarrow \mathrm{H}^{\prime} 0000041 \mathrm{~A}\right)$. If data that uses the program time unit is read and is displayed as 99.59, the read data will be H'000026E7 $(99.59 \rightarrow 9959 \rightarrow$ H'000026E7).

### 6.5 Read from Variable Area

Read from a variable area by setting the required data in the following FINS-mini command text format.
Command FINS-mini Command Text

| Data name | Description |
| :--- | :--- |
| MRC/SRC | Specify the Read from Variable Area FINS-mini <br> command. |
| Variable type | Specify the variable type. |
| Read start address | Specify the first address to read. |
| Bit position | Not used on the E5AR-T/ER-T. Specify "00." |
| Number of elements | Specify the number of variables to read (max. of <br> $\left.25\left(H^{\prime} 19\right)\right) . ~ N o t ~ n e e d e d ~ f o r ~ a ~ c o m p o u n d ~ r e a d . ~$ |

## Response

## FINS-mini Response Text

| Data name | Description |
| :--- | :--- |
| MRC/SRC | The FINS-mini command text is returned here. |
| Response code | Result of execution of the command. |
| Read data | Data that was read. |

## Response Codes

| Response <br> code | Error name | Description |
| :---: | :--- | :--- |
| "1001" | Command length too <br> long | The command is too long. |
| "1002" | Command length too <br> short | The command is too short. |
| "1101" | Area type error | Incorrect variable type. |
| "110B" | Response length too <br> long | Number of elements is greater <br> than 25 (H'0019). |
| "1100" | Parameter error | Specified bit position is not "00." |
| "2203" | Operation error | Unit error, unit change, display <br> unit error, or EEPROM error. |
| "0000" | Normal end | --- |

### 6.6 Write to Variable Area

Write to a variable area by setting the required data in the following FINS-mini command text format.

## Command

FINS-mini Command Text

| Data name | Description |
| :--- | :--- |
| MRC/SRC | Specify the Write to Variable Area FINS-mini com- <br> mand. |
| Variable type | Specify the variable type. |
| Write start address | Specify the first address to write. |
| Bit position | Not used on the E5AR-T/ER-T. Specify "00." |
| Number of elements | Specify the number of variables to be written (max. <br> of 25 (H'18)). Not needed for a compound write. |
| Write data | Enter the data to be written. |

## Response <br> FINS-mini Response Text

| Data name | Description |
| :--- | :--- |
| MRC/SRC | FINS-mini command text is returned here. |
| Response code | Result of execution of the command. |

## Response Codes

| Response <br> code | Error name | Description |
| :---: | :--- | :--- |
| "1002" | Command length <br> too short | The command is too short. |
| "1101" | Area type error | Incorrect variable type. |
| "1003" | Number of ele- <br> ments/data num- <br> ber do not agree | The specified number of elements does <br> not agree with the actual number of data <br> elements. |
| "1100" | Parameter error | Specified bit position is not "00." <br> Write data was outside of setting range. |

| $\begin{array}{c}\text { Response } \\ \text { code }\end{array}$ | Error name | Description |
| :---: | :--- | :--- |
| "2203" | Operation error | $\begin{array}{l}\text { • Unable to execute because the } \\ \text { communications writing function is } \\ \text { disabled. } \\ \text { • Write to setting area 1 was attempted } \\ \text { from setting area 0. } \\ \text { - Write to parameters in Protect Level } \\ \text { was attempted from a different level. } \\ \text { - AT is being executed. } \\ \text { • Calibration Level is being used. } \\ \text { • Unit error, unit change, display unit } \\ \text { error, or EEPROM error. }\end{array}$ |
| $\cdot$ •Program number changed during |  |  |
| programmed operation. |  |  |$\}$

### 6.7 Operation Commands

Operation commands are sent using the following FINS-mini command text format.

| Data name | Description |
| :--- | :--- |
| MRC/SRC | Specify the Operation Command FINS-mini com- <br> mand. |
| Operation code | Specify the operation code. |
| Related information | Specify information related to the command. |

The operation commands that are supported by the E5AR-T/ER-T are listed in the following table.

| Operation code | Name | Related information |  |
| :---: | :---: | :---: | :---: |
|  |  | Higher byte | Lower byte |
| "00" | Communications Writing | $0{ }^{* 1}$ | 0: OFF (disabled) <br> 1: ON (enabled) |
| "01 | Run/Reset | 0 to 3, F*2 | $\begin{aligned} & \text { 0: Run } \\ & \text { 1: Reset } \end{aligned}$ |
| "03" | AT Execute | 0 to 3, F*2 | 0 : Current PID set number 1 to 8: PID set number |
| "04" | RAM Write Mode | $0 * 1$ | 0: Backup Mode <br> 1: RAM Write Mode |
| "05" | Save RAM Data | $0{ }^{* 1}$ | 0 |
| "06" | Software Reset | $0{ }^{* 1}$ | 0 |
| "07" | Move to Setting Area 1 | $0 * 1$ | 0 |
| "08" | Move to Protect Level | $0 * 1$ | 0 |
| "09" | Auto/Manual | 0 to 3, F*2 | 0: Auto Mode <br> 1: Manual Mode |
| "0A" | AT Cancel | 0 to 3, F *2 | 0: Cancel |
| "0B" | Parameter Initialization | $0{ }^{* 1}$ | 0 |
| "0C" | Alarm Latch Cancel | 0 to 3, F*2 | 0 |
| "0D" | SP Mode | 0 to 3, F*2 | $\begin{aligned} & \text { 0: PSP } \\ & \text { 1: RSP } \\ & \text { 2: FSP } \end{aligned}$ |
| "12" | Hold | 0 to 3, F*2 | 0: Hold Cancel <br> 1: Hold |
| "13" | Advance | 0 to 3, F*2 | 0 |
| "14" | Back | 0 to 3, F*2 | 0 |

*1: Executed for all channels.
*2: Specify the channel.
0 : CH1, 1: CH2, 2: CH3, 3: CH4, F: All channels
Note: When all channels is specified, only enabled channels will respond and processing will begin from channel 1. If an error is detected on any one channel, an operation error will occur. If all channels end normally, a normal end will occur.

When cascade control is selected for the control mode, specify channel 2 commands for the following operation commands:

- Run/Reset
- Auto/Manual
- SP Mode
- Cascade Open/Close

## Response <br> FINS-mini Response Text

| Data name | Description |
| :--- | :--- |
| MRC/SRC | FINS-mini command text is returned here. |
| Response code | Result of execution of the command. |

## Response Codes

| Response <br> code | Error name | Description |
| :---: | :--- | :--- |
| "1001" | Command length <br> too long | The command is too long. |
| "1002" | Command length <br> too short | The command is too short. |
| "1100" | Parameter error | Operation code or related information is <br> not correct. |
| "2203" | Operation error | • Unable to execute because the <br> communications writing function is <br> disabled. <br> • Unable to execute operation <br> command. For more information, refer <br> to corresponding operation command <br> description in 6.9 Commands and <br> Responses. <br> • Unit error, unit change, display unit <br> error, or EEPROM error. |
| "0000" | Normal end | --- |

### 6.8 Setting Areas

The E5AR-T/ER-T has two setting areas for communications: Setting area 0 and setting area 1.
In setting area 0, operation continues. Setting area 0 makes it possible to perform operations that require operation to be in progress, such as reading the PV, writing an SP, and starting/resetting operation (Run/ Reset), as well as operations that do not interfere with control. On the other hand, operations that may change control, such as writing initial set values, cannot be performed. (Set values that cannot be written can still be read.)
In setting area 1, operation is stopped. This makes it possible to perform operations such as writing initial set values, which cannot be written in setting area 0.
When the power is turned ON, setting area 0 is selected. To access setting area 1, use the Move to Setting Area 1 operation command. To return to setting area 0 from setting area 1, turn OFF the power or use the Software Reset operation command.

| Variable <br> type | Description | Area |
| :---: | :--- | :---: |
| C4 | Communications Monitor |  |
| C5 | Protect Level |  |
| C6 | Operation Level |  |
| C7 | Adjustment Level | Setting area 0 <br> (Operation in <br> progress.) |
| C8 | Adjustment 2 Level |  |
| C9 | Alarm Set Setting Level |  |
| CA | PID Setting Level |  |
| CB | Approximation Setting Level |  |
| D8 | Program Setting Level |  |
| D9 | Time Signal Setting Level |  |

| Variable <br> type | Description | Area |
| :---: | :--- | :---: |
| CC | Input Initial Setting Level |  |
| CD | Control Initial Setting Level |  |
| CE | Control Initial Setting 2 Level | Setting area 1 <br> (Operation <br> stopped.) |
| CF | Alarm Setting Level |  |
| D0 | Display Adjustment Level |  |
| D1 | Communications Setting Level |  |
| D2 | Advanced Function Setting Level |  |
| D3 | Expansion Control Setting Level |  |

### 6.9 Commands and Responses

The E5AR-T/ER-T provides a set of commands that read from variable areas, write to variable areas, execute operation commands, and execute other services provided by the CompoWay/F communications protocol. The commands supported by the E5AR-T/ER-T are described below.

## Reading Monitor Values

| Variable type | Address | Monitor value |  | Address | Monitor value |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Ch | Parameter name |  | Ch | Parameter name |
| "C4" | "0005" | 1 | PID Set Number Monitor | "0205" | 3 | PID Set Number Monitor |
|  | "0006" |  | Status | "0206" |  | Status |
|  | "0007" |  | Program Status | "0207" |  | Program Status |
|  | "0008" |  | Alarm Set Number Monitor | "0208" |  | Alarm Set Number Monitor |
|  | "0105" | 2 | PID Set Number Monitor | "0305" | 4 | PID Set Number Monitor |
|  | "0106" |  | Status | "0306" |  | Status |
|  | "0107" |  | Program Status | "0307" |  | Program Status |
|  | "0108" |  | Alarm Set Number Monitor | "0308" |  | Alarm Set Number Monitor |

This command is used to read present values, status, and other monitor values. The number of elements can be set from 0002 to 0019 to allow reading monitor values in consecutive addresses.
When used in setting area 1 , the response for the present value and internal SP will be 0 and the response for the status will be as indicated in the notes in E5 $\square R$ - $T$ Status (Communications) (P. A-8).

## Response

| MRC | SRC | Response code |  | Data |
| :---: | :---: | :---: | :---: | :---: |
| "01" | "01" | "0000" | Monitor value $, \ldots, 1$ |  |

## Response Codes:

The response for a normal end is shown above. For the response codes, refer to 6.5 Read from Variable Area (P. 6-10).

Reading Set Values

Command

| Variable type | Address | Parameters |  |
| :---: | :---: | :---: | :---: |
|  |  | Ch | Description |
| "C5" | "0000" to "004F" | 1 | Parameters in setting area 0 <br> Protect Level <br> Operation Level <br> Adjustment Level <br> Adjustment 2 Level <br> Alarm Set Setting Level <br> PID Setting Level <br> Approximation Setting Level Program Setting Level Time Signal Setting Level |
| "C7" | "0100" to "014F" | 2 |  |
| "C8" |  |  |  |
| "C9" | "0200" to "024F" |  |  |
| "CA" | "0200' to "024F' | 3 |  |
| "D8" |  | 4 |  |
| "D9" | "0300" to "034F" |  |  |

| Variable type | Address | Parameters |  |
| :---: | :---: | :---: | :---: |
|  |  | Ch | Description |
| "CC" | "0000" to "003B" | 1 | Parameters in Setting Area 1 Input Initial Setting Level Control Initial Setting Level Control Initial Setting 2 Level Alarm Setting Level Display Adjustment Level Communications Setting Level Advanced Function Setting Level Expansion Control Setting Level |
| "CE" | "0100" to "013B" | 2 |  |
| "D0" | "0200" to "023B" | 3 |  |
| "D3" | "0300" to "033B" | 4 |  |

This command is used to read set values. The number of elements can be set from 0002 to 0019 to allow reading 2 to 25 set values in consecutive addresses.
To specify variable types and addresses, refer to Appendix Setting Lists (P. A-6). The upper limit of an address depends on the variable type.
This command can be used in both setting area 0 and setting area 1 . When used in setting area 1 , the response for the remote SP monitor, ramp SP monitor, and valve opening monitor will be 0 and the response for the status is as indicated in the notes in $E 5 \square R-T$ Status (Communications) (P. A-8).

Response

Response Codes:
The response for a normal end is shown above. For the response codes, refer to 6.5 Read from Variable Area (P. 6-10).

## Composite Read from Variable Area

## Command

| Variable <br> type | Address | Parameters |  |
| :---: | :---: | :---: | :---: |
|  |  | Ch | Description |
| "C4" | "0000" to "0008" | 1 | Monitor values |
|  | "0100" to "0108" | 2 |  |
|  | "0200" to "0208" | 3 |  |
|  | "0300" to "0308" | 4 |  |

| Variable type | Address | Parameters |  |
| :---: | :---: | :---: | :---: |
|  |  | Ch | Description |
| "C5" to "CB" | "0000" to "004F" | 1 | Parameters in setting area 0 |
|  | "0100" to "014F" | 2 |  |
|  | "0200" to "024F" | 3 |  |
|  | "0300" to "034F" | 4 |  |
| "CC" to "D3" | "0000" to "003B" | 1 | Parameters in setting area 1 |
|  | "0100" to "013B" | 2 |  |
|  | "0200" to "023B" | 3 |  |
|  | "0300" to "033B" | 4 |  |

Multiple monitor values or set values can be read by sending a single command. Up to 20 items can be read even if the addresses are not consecutive.

To specify variable types and addresses, refer to Appendix Setting Lists (P. A-6). The upper limit of an address depends on the variable type.
This command can be used in both setting area 0 and setting area 1.
If an area type error or a set value error occurs in any of the data being read, no data will be read.

| MRC | SRC | Response code | Variable type |  | Data |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{gathered} " 01 " \\ \hline \end{gathered}$ | "04" | $\stackrel{\text { "0000" }}{\perp}$ | Type |  | Monitor value/Set value | , |  |

## Response Codes:

The response for a normal end is shown above. For the response codes, refer to 6.5 Read from Variable Area (P. 6-10).

## Writing Set Values in Protect Level

## Command

| Address | Parameter |
| :---: | :--- |
| "0000" | Operation Adjustment Protection |
| "0001" | Initial Setting Protection |
| "0002" | Setting Change Protection |
| "0003" | PF Key Protection |

This command writes set values in the Protect Level. Refer to 5.5 Protecting Settings (P. 5-23) for information on Protect Level.
This command is used in setting area 0 . An operation error will occur if it is used in setting area 1.

To use this command, first enable using the communications writing function by executing the Communications Writing operation command, and then move to Protect Level by executing the Move to Protect Level operation command.

| MRC | SRC | Response code |  |
| :---: | :---: | :---: | :---: |
| "01" | "02" | "0000" |  |
| 1 |  |  |  |

Response Codes:
The response for a normal end is shown above. For the response codes, refer to 6.6 Write to Variable Area (P. 6-11).

## ■ Writing Set Values

Command

| Variable type | Address | Parameter |  |
| :---: | :---: | :---: | :---: |
|  |  | Ch | Description |
| "C5" | "0000" to "004F" | 1 | Parameters in setting area 0 Operation Level Adjustment Level Adjustment 2 Level Alarm Set Setting Level PID Setting Level Approximation Setting Level Program Setting Level Time Signal Setting Level |
| "C7" |  |  |  |
| "C8" | "0100" to "014F" | 2 |  |
| "C9" |  |  |  |
| "CA" | "0200" to "024F" | 3 |  |
| "CB" |  |  |  |
| "D8" | "0300" to "034F" | 4 |  |

| Variable <br> type | Address | Parameter |  |
| :---: | :---: | :---: | :---: |
|  |  | Ch | Description |
| "CC" | "0000" to "003B" | 1 | Parameters in Setting Area 1 <br> Input Initial Setting Level <br> "CD" |
| Control Initial Setting Level |  |  |  |
| "CE" | "0100" to "013B" | 2 | Control Initial Setting 2 Level <br> Alarm Setting Level <br> Display Adjustment Level <br> "D0" |
| Communications Setting Level <br> "D1" | "0200" to "023B" | 3 | Advanced Function Setting Level <br> Expansion Control Setting Level |
| "D3" | "0300" to "033B" | 4 |  |

This command is used to write set values. The number of elements can be set from 2 to 24 to write set values at consecutive addresses.

To specify an address, refer to Appendix Setting Lists (P. A-6).
Parameters in setting area 1 can be written from setting area 1. An operation error will occur if parameters are written from setting area 0.

To use this command, the communications writing function must be enabled using the Communications Writing operation command.
To store the set values for Operation, Program Setting, Adjustment, Adjustment 2, Alarm Set Setting, PID Setting, Time Signal Setting, or Approximation Setting Level in EEPROM, select "Backup Mode" and execute the RAM Write Mode command. If "Backup Mode" is not selected, the set values will not remain in memory when the power is turned OFF. For more information on the above levels, refer to 4.1 Setting Levels and Key Operations (P. 4-2).

Response Codes:
The response for a normal end is shown above. For the response codes, refer to 6.6 Write to Variable Area (P. 6-11).

## Set Value Compound Write

## Command

| Variable <br> type | Address | Parameters |  |
| :---: | :---: | :---: | :---: |
|  |  | Ch | Description |
| "C5" to "CB" <br> "D8" to "D9" | "0100" to "014F" | 2 | Parameters in setting area 0 0 |
|  | "0200" to "024F" | 3 |  |
|  | "0300" to "034F" | 4 |  |
|  |  |  |  |
|  | "0000" to "003B" | 1 |  |
|  | "0100" to "013B" | 2 |  |
|  | "0200" to "023B" | 3 |  |
|  | "0300" to "033B" | 4 |  |

Multiple set values can be written by sending a single command. Up to 12 items can be written even if the addresses are not consecutive.

To specify variable types and addresses, refer to Appendix Setting Lists (P. A-6).
Parameters in setting area 1 is written in setting area 1. An operation error will occur if parameters are written in setting area 0.

To use this command, the communications writing function must be enabled using the Communications Writing operation command.

To store the set values for Operation, Program Setting, Adjustment, Adjustment 2, Alarm Set Setting, PID Setting, Time Signal Setting, or Approximation Setting Level in EEPROM, select "Backup Mode" and execute the RAM Write Mode command. If "Backup Mode" is not selected, the set values will not remain in memory when the power is turned OFF. For more information on the above levels, refer to 4.1 Setting Levels and Key Operations (P. 4-2).

## Response

| MRC | SRC | Response code |  |
| :---: | :---: | :---: | :---: |
| "01" | "13" | "0000" |  |
| 1 | 1 |  |  |

Response Codes:
The response for a normal end is shown above. For the response codes, refer to 6.6 Write to Variable Area (P. 6-11).

## Composite Read Registration

## Command

| Variable type | Address | Parameters |  |
| :---: | :---: | :---: | :---: |
|  |  | Ch | Description |
| "C4" | "0000" to "0008" | 1 | Monitor values |
|  | "0100" to "0108" | 2 |  |
|  | "0200" to "0208" | 3 |  |
|  | "0300" to "0308" | 4 |  |
| "C5" to "CB" <br> "D8" to "D9" | "0000" to "004F" | 1 | Parameters in setting area 0 |
|  | "0100" to "014F" | 2 |  |
|  | "0200" to "024F" | 3 |  |
|  | "0300" to "034F" | 4 |  |
| "CC" to "D3" | "0000" to "003B" | 1 | Parameters in setting area 1 |
|  | "0100" to "013B" | 2 |  |
|  | "0200" to "023B" | 3 |  |
|  | "0300" to "033B" | 4 |  |

This command is used to store the addresses of multiple monitor values or set values that you wish to read. The stored monitor values or set values can be read by sending a single Composite Read from Variable Area command. Up to 20 items can be stored, even if the addresses are not consecutive.
To specify variable types and addresses, refer to Appendix Setting Lists (P. A-6). The upper limit of an address depends on the variable type.

This command can be used in both setting area 0 and setting area 1 .

## Response

| MRC | SRC | Response code |
| :---: | :---: | :---: |
| $" 01 "$ | $" 11 "$ | "0000" |

## Response Codes:

The response for a normal end is shown above. For the response codes, refer to 6.5 Read from Variable Area (P. 6-10).

## ■ Composite Read Registration Confirmation

## Command

This command is used to check the contents that were stored using the Composite Read Registration command.

| MRC | SRC | Response c | Variable type | Read address |  |  |  | Bit position |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| "01" | "12" | , "0000" | Type | 1 | 1 | 1 |  |  |
|  |  |  | Variable type |  | Read address |  |  |  |
|  |  |  | Type |  | +1 |  |  | "00" |

Response Codes:
The response for a normal end is shown above. For the response codes, refer to 6.5 Read from Variable Area (P. 6-10).

## Composite Registration Read

## Command

| MRC | SRC |
| :---: | :---: |
| "01" | "10" |

This command is used to read the monitor values and set values that were registered using the Composite Read Registration command. This enables reading multiple monitor values and set values with one command.

This command can be used in both setting area 0 and setting area 1.
If an area type error or a set value error occurs in any of the data being read, no data will be read.

## Response

| MRC | SRC | Response code | Variable type |  | Data |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| "01" | "10" | "0000" | Type | 1 | Monitor value/Set value |  |  |

| Variable type |  | Data |
| :---: | :---: | :---: |
| Type | Monitor value/Set value |  |

Response Codes:
The response for a normal end is shown above. For the response codes, refer to 6.5 Read from Variable Area (P. 6-10).

## ■ Communications Writing

Command

| Related <br> information | Description |
| :---: | :---: |
| "00" | Communications Writing Disabled |
| "01" | Communications Writing Enabled |

This command is used to enable or disable the communications writing function. It changes the setting of the Communications Writing parameter.

When the communications writing function is disabled, communications cannot be used to write set values or send operation commands, such as the Run/Reset operation command.

## The default setting is "Communications Writing Disabled."

This command can be used in both setting area 0 and setting area 1.

## Response

| MRC | SRC | Response code |
| :---: | :---: | :---: |
| "30" | "05" | "0000" |

Response Codes:
The response for a normal end is shown above. For the response codes, refer to 6.7 Operation Commands (P. 6-13).

■ Run/Reset

Command

| MRC | SRC | Instruction <br> code | Related <br> information |
| :---: | :---: | :---: | :---: |
| $" 30 "$ | $" 05 "$ | "01" |  |

| Related information | Description |  |
| :---: | :---: | :---: |
|  | Ch | Control state |
| "00" | 1 | Run |
| "01" |  | Reset |
| "10" | 2 | Run |
| "11" |  | Reset |
| "20" | 3 | Run |
| "21" |  | Reset |
| "30" | 4 | Run |
| "31" |  | Reset |
| "F0" | All | Run |
| "F1" |  | Reset |

This command is used to start or reset control.
This command can be used in setting area 0 .
If "All" is selected for the channel, only the channels that are enabled will be affected by this command.

To use this command, the communications writing function must be enabled using the Communications Writing operation command.

## Response

| MRC | SRC | Response code |  |
| :---: | :---: | :---: | :---: |
| "30" <br> $\perp$ | "05" <br> $\perp$ | "0000" |  |

## Response Codes:

The response for a normal end is shown above. For the response codes, refer to 6.7 Operation Commands (P. 6-13).

## AT Execute

## Command

| Related <br> information | Description |  |
| :--- | :---: | :--- |
|  | Ch | Command mode |
| "00" to "08" | 1 | 00: Current PID set number <br> 01 to 08: PID set number 1 to 8 |
| "10" to "18" | 2 | 10: Current PID set number <br> 11 to 18: PID set number 1 to 8 |
| "20" to "28" | 3 | 20: Current PID set number <br> 21 to 28: PID set number 1 to 8 |
| "30" to "38" | 4 | 30: Current PID set number <br> 31 to 38: PID set number 1 to 8 |
| "F0" to "F8" | All | F0: Current PID set number <br> F1 to F8: PID set number 1 to 8 |

This command executes AT. On the E5AR-T/ER-T, the PID set number must be specified when executing AT.

To specify the current PID set number (the PID set currently being used for operation), set the lower byte of the related information to 0 .
This command is used in setting area 0 . An operation error will occur if it is used in setting area 1. An operation error will also occur in the following cases:

- If the Run/Reset parameter is set to "Reset" for the specified channel
- If the Auto/Manual parameter is set to "Manual" for the specified channel
To use this command, the communications writing function must be enabled using the Communications Writing operation command.

| MRC | SRC | Response code |
| :---: | :---: | :---: |
| "30" | "05" | "0000" |

Response Codes:
The response for a normal end is shown above. For the response codes, refer to 6.7 Operation Commands (P. 6-13).

## AT Cancel

## Command

| Related <br> information | Description |  |
| :---: | :---: | :---: |
|  | Ch | Operation |
| "00" | 1 | AT Cancel |
| "10" | 2 | AT Cancel |
| "20" | 3 | AT Cancel |
| "30" | 4 | AT Cancel |
| "F0" | All | AT Cancel |

This command cancels AT.
This command is used in setting area 0 . An operating error will occur if it is used in setting area 1. An operation error will also occur in the following cases:

- If the Run/Reset parameter is set to "Reset" for the specified channel
- If the Auto/Manual parameter is set to "Manual" for the specified channel
To use this command, the communications writing function must be enabled using the Communications Writing operation command.

## Response

Response Codes:
The response for a normal end is shown above. For the response codes, refer to 6.7 Operation Commands (P. 6-13).

## Write Mode

## Command

| MRC | SRC | Instruction <br> code |  |
| :---: | :---: | :---: | :---: |
| Related <br> information |  |  |  |
| "30" | "05" | "04" |  |
| 1 |  |  |  |

| Related <br> information | Description |
| :---: | :--- |
| "00" | Backup Mode |
| "01" | RAM Write Mode |

This command is used to select the Backup Mode or RAM Write Mode.

The default setting is "Backup Mode."
This command can be used in both setting area 0 and setting area 1.
To use this command, the communications writing function must be enabled using the Communications Writing operation command.

| Write mode | Description |
| :---: | :--- |
| Backup Mode | $\begin{array}{l}\text { When communications are used to write set values in } \\ \text { the Operation, Program Setting, Adjustment, Adjust- } \\ \text { ment 2, Alarm Set Setting, PID Setting, Time Signal } \\ \text { Setting, or Approximation Setting Level, the data is } \\ \text { also written to EEPROM. }\end{array}$ |
|  | $\begin{array}{l}\text { When communications are used to write set values in } \\ \text { the Operation, Program Setting, Adjustment, Adjust- } \\ \text { ment 2, Alarm Set Setting, PID Setting, Time Signal } \\ \text { Setting, or Approximation Setting Level, the data is }\end{array}$ |
| RAM Write Mode |  |
| not written to EEPROM. |  |
| When SP tracking or PV tracking is ON and the mode |  |
| is changed to Remote SP Mode or Manual Mode, the |  |
| SP is not written to EEPROM. |  |
| When a change is made to a parameter setting using |  |
| a key operation, the data is written to EEPROM. |  |$\}$

When the write mode is changed from RAM Write Mode to Backup Mode, the set values in the Operation Level, Program Setting Level, Adjustment Level, Adjustment 2 Level, Alarm Set Setting Level, PID Setting Level, Time Signal Setting Level, and Approximation Setting Level are written to EEPROM. Each level is described in 4.1 Setting Levels and Key Operations (P. 4-2).

The time required for RAM backup depends on the number of settings that were changed in RAM Backup Mode. The more settings that were changed, the longer the time required. For example, if all settings in the Operation, Program Setting, Adjustment, Adjustment 2, Alarm Set Setting, PID Setting, Time Signal Setting, and Approximation Levels were changed, the most time would be required, which is about 5 seconds.

## Response

| MRC | SRC | Response code |
| :---: | :---: | :---: |
| $" 30 "$ | $" 05 "$ | "0000" |

## Response Codes:

The response for a normal end is shown above. For the response codes, refer to 6.7 Operation Commands (P. 6-13).

## Save RAM Data

## Command

| MRC | SRC | Instruction <br> code | Related <br> information |
| :---: | :---: | :---: | :---: |
| $" 30 "$ | $" 05 "$ | "05" | "00" |

This command writes the set values in the Operation Level, Program Setting Level, Adjustment Level, Adjustment 2 Level, Alarm Set Setting Level, PID Setting Level, Time Signal Setting Level, and Approximation Setting Level to EEPROM. For information on these levels, refer to 4.1 Setting Levels and Key Operations (P. 4-2).
This command can be used in both setting area 0 and setting area 1.
To use this command, the communications writing function must be enabled using the Communications Writing operation command.

## Response

| MRC | SRC |  | Response code |

| :---: | :---: | :---: | :---: |
| "30" | "05" | "OB" | "00" |

This command returns all settings to the default settings.
This command is used in setting area 1. An operating error will occur if it is used in setting area 0 .

To use this command, the communications writing function must be enabled using the Communications Writing operation command.

Response Codes:
The response for a normal end is shown above. For the response codes, refer to 6.7 Operation Commands (P. 6-13).

## ■ Alarm Latch Cancel

## Command

| Related <br> information | Description |  |
| :---: | :---: | :---: |
|  | Ch | Command mode |
| "00" | 1 | Alarm Latch Cancel |
| "10" | 2 | Alarm Latch Cancel |
| "20" | 3 | Alarm Latch Cancel |
| "30" | 4 | Alarm Latch Cancel |
| "F0" | All | Alarm Latch Cancel |

This command cancels the alarm latch. The command is used when the alarm latch function is in use.

This command can be used in both setting area 0 and setting area 1.
If AT is being executed for the specified channel, an operation error will occur.

To use this command, the communications writing function must be enabled using the Communications Writing operation command.

Response Codes:
The response for a normal end is shown above. For the response codes, refer to 6.7 Operation Commands (P. 6-13).

## Controller Attribute Read

## Command

This command reads the E5AR-T/ER-T model number and communications buffer size. The command can be used in any state of the E5AR-T/ER-T.

## Response Codes:

The response for a normal end is shown above. For the response codes, refer to 6.5 Read from Variable Area (P. 6-10).

Model Number

*Bytes 7 to 9 are not used.
(1) Size

| Symbol | Size |
| :---: | :---: |
| A | A size |
| E | E size |

(2) Fixed/Program

| Symbol | Fixed/program |
| :---: | :---: |
| T | Program |

(3) Standard/Position-proportional

| Symbol | Standard/position <br> proportional |
| :---: | :---: |
| (Blank) | Standard |
| P | Position-proportional |

## Controller Status Read

This command reads the operating status of the E5AR-T/ER-T.
The command can be used in any state of the E5AR-T/ER-T.

## Response

Response Codes:
The response for a normal end is shown above. For the response codes, refer to 6.5 Read from Variable Area (P. 6-10).

- Operating Status

| Bit position | Operating status |
| :---: | :---: |
| 00 | Operating |
| 01 | Error <br> (MV at PV error output) |
| 10 | Stopped <br> (including setting area 1) |
| 11 | Manual Mode |

The operating status of each channel is indicated using a 2-bit code.

- Related Information

| Bit position | Status |  | Bit value |  |
| :---: | :--- | :---: | :---: | :---: |
|  |  | $\mathbf{0}$ | $\mathbf{1}$ |  |
| 0 | Not used. | - | - |  |
| 1 | Not used. | - | - |  |
| 2 | Not used. | - | - |  |
| 3 | RSP input error | No error | Error |  |
| 4 | Potentiometer error | No error | Error |  |
| 5 | Exceeds display range | No error | Error |  |
| 6 | Input error | No error | Error |  |
| 7 | Not used. | - | - |  |

Note: The bit value is an OR of all channels set in the Number of Enabled Channels parameter.

If the channel does not exist, "No error (0)" is returned.
If this command is used in setting area 1, the related information is undefined.

## Echoback Test

This command is used to perform an echoback test.
The command can be used in any state of the E5AR-T/ER-T.
Keep the test data within the following ranges depending on the communications data length.

| Communications <br> data length | Contents |
| :---: | :--- |
| 7 bits | ASCII H'20 to H'7E |
| 8 bits | ASCII H'20 to H'7E or H'A1 to H'FE |

Response

| MRC | SRC | Response code | Test data |
| :---: | :---: | :---: | :---: |
| "08" | "01" | "0000" | $0 \sim-200$ bytes |

Response Codes:
The response for a normal end is shown above. For the response codes, refer to 6.7 Operation Commands (P. 6-13).

### 6.10 Program Example

## N88Basic

This program displays the response from the E5AR-T/ER-T on the screen when command data is entered from the keyboard.

Command data from the unit number to the number of elements must be entered.

The program was created in N88BASIC.

```

7.8 Setting Areas ..... 7-18
7.9 Commands and Responses ..... 7-20

### 7.1 Communications Method

## Modbus Communications

Modbus communications are based on the RTU Mode of the Modbus Protocol of Modicon Inc. (specifications: PI-MBUS-300 Revision J). Detailed specifications for the Modbus protocol are provided below.

## Supplement

Communications are implemented by creating a program on the host computer. The descriptions in this section are therefore from the perspective of the host computer. For example, "reading" and "writing" refer to the host computer reading from and writing to the E5AR-T/ERT.

## Communications Specifications

| Transfer connection | Multi-point |
| :--- | :--- |
| Communications method | RS-485 (2-wire, half duplex) |
| Synchronization method | Start-stop |
| Baud rate | $9.6,19.2$, or 38.4 Kbit/s |
| Send code | RTU (Remote Terminal Unit) |
| Data length | 8 bits |
| Stop bit length | Automatically determined by vertical parity <br> setting. |
| Error detection | Vertical parity: None, even, or odd <br> CRC-16 (Cyclical Redundancy Check) |
| Flow control | None |
| Interface | RS-485 |
| Retry function | None |
| Communications buffer | 217 bytes |
| Communications <br> response send wait time | 0 to 99 ms <br> Default: $20 ~ m s ~$ |

Note: Default settings are shaded.

The host computer sends a command frame, and the E5AR-T/ER-T returns a response frame based on the contents of the command frame. One response frame is sent in response to one command frame.

Host computer

E5AR/ER-T
The exchange of the command frame and response frame is described below.

After a receiving a response from the Controller, have the host computer wait at least 5 ms before sending the next command.

When writing multiple sets of parameters in a row, such as when writing to the variable area or performing a compound write, control characteristics may be affected. Observe the following points.

### 7.2 Frames

Commands from the host computer and responses from the E5AR-T/ER-T take the form of frames that conform to the Modbus (RTU) protocol. The data included in command frames and response frames is described in this section.

In the following descriptions, an " H " before a numeric value (for example $\mathrm{H}^{\prime} 02$ ) indicates that the value is a hexadecimal number. Numbers or letters enclosed in quotation marks (for example "00") are ASCII characters.

## Command Frames

In RTU Mode, each frame begins and ends with a silent time interval that is at least 3.5 characters long.

|  | Silent interval at least 3.5 characters long. |
| :---: | :--- |
| Slave address | Specify the unit number of the E5AR-T/ER-T between <br> H'00 and H'63 (0 to 99). When broadcasting to all nodes, <br> specify H'00. Responses are not returned for broadcasts. |
| Function code | The function code specifies the command from the host <br> computer. The code is set in hexadecimal and is 1 byte <br> long. For more information, refer to 7.3 List of Functions <br> (P. 7-7). |
| Data | The text of command based on the function code. Speci- <br> fies variable addresses and the values for set values in <br> hexadecimal. |
| CRC-16 | Cyclical Redundancy Check <br> These two bytes store check code calculated from the <br> slave address to the end of the data in hexadecimal. |
|  | Silent interval at least 3.5 characters long. |

- Example of CRC-16 Calculation

A message is processed 1 byte at a time in a 16-bit processing register called the CRC register.

## Supplement

CRC-16 Calculation Method:
As described below, the value from the slave address through the end of the data is calculated and the result set as the CRC-16.
(1) An initial value of H'FFFF is set in the CRC register.
(2) An XOR is taken of the contents of the CRC register and the 1st byte of the message, and the result is returned to the CRC register.
(3) The contents of the CRC register is shifted 1 bit to the right, and 0 is placed in the MSB.
(4) If the bit shifted from the LSB is 0 , step 3 is repeated.

If the bit shifted from the LSB is 1 , an XOR is taken of the contents of the CRC register and H'A001, and the result is returned to the CRC register.
(5) Steps 3 and 4 are repeated until the contents of the register have been shifted 8 bits to the right.
(6) If the end of the message has not been reached, an XOR is taken of the next byte of the CRC register and the message, the result is returned to the CRC register, and the procedure is repeated from step (3).
(7) The result (the value in the CRC register) is placed in the lower byte of the message.
Example of Appending the Result
If the calculated CRC value is $\mathrm{H}^{\prime} 1234$, this is appended as follows to the command frame:

## ■ Response Frames

## - Normal Response Frames

## - Error Response Frames

| Slave address | The unit number that was specified in the command <br> frame is returned here. This is the unit number of the <br> responding E5AR-T/ER-T. |
| :---: | :--- |
| Function code | The function code that was received is returned here. <br> In an error response frame, "H'80" is added to the value <br> to indicate that this is an error response. <br> Example: Received function code = H'03 <br> Function code in error response frame = H'83 |
| Error code | An end code that indicates the error. |
| CRC-16 | Cyclical Redundancy Check <br> These two bytes are a check code calculated from the <br> slave address through the end of the data in hexadeci- <br> mal. |

## - Error Codes

| End <br> code | Name | Description | Error <br> detection <br> priority |
| :--- | :--- | :--- | :---: |
| H'01 | Function <br> code error | Received an unsupported function code. | 1 |
| H'02 | Variable <br> address <br> error | The variable area number specified in the <br> variable address is out of range. | 2 |
| H'03 | Variable <br> data error | The number of elements does not agree with <br> the number of data items. <br> Number of elements times 2 does not agree <br> with the byte count. <br> The response length exceeds the communi- <br> cations buffer size. <br> The operation code or related information in <br> an operation command is not correct. <br> The written data exceeds the setting range. | 3 |
| H'04 | Operation <br> error | The setting in the write data is not permitted <br> in the current operating mode. <br> - The communications writing function is <br> disabled <br> - Attempted to write to set values insetting <br> area 1 from setting area 0. <br> - Attempted to write to Protect Level set <br> values from another level. <br> - AT is being executed. <br> - The program number was changed during <br> programmed operation. <br> - User calibration is in progress. <br> - The operation command cannot be <br> processed. <br> - Unit error, unit change, display unit error, or <br> EEPROM error. | 4 |

## - No Response

In the following cases, the received command is not processed and a response is not returned. A timeout will occur at the host device.

- The slave address in the received command is different from the communications unit number set in the E5AR-T/ER-T.
- A parity error, framing error, or overrun error occurred due to a transfer error or other error.
- A CRC-16 code error occurred in the received command frame.
- A time interval greater that 3.5 characters occurred between data while receiving a command frame.

### 7.3 List of Functions

The function codes supported by the E5AR-T/ER-T are listed below.

- Function Codes

| Function <br> codes | Name | Description |
| :--- | :---: | :--- |
| $03\left(H^{\prime} 03\right)$ | Read from Variable Area | Reads a variable area. Multiple <br> variables that are consecutive <br> can be read. |
| $16\left(H^{\prime} 10\right)$ | Write to Variable Area | Writes to a variable area. <br> Multiple variables that are con- <br> secutive can be written. <br> Broadcasting is possible. |
| $06\left(H^{\prime} 06\right)$ | Operation Command | Writes an operation command. <br> Broadcasting is possible. |
| $08\left(H^{\prime} 08\right)$ | Echoback Test | Performs an echoback test. |

### 7.4 Variable Areas

The areas used for data exchange when communicating with the E5AR-T/ER-T are called the variable areas. Present values can be read, and set values can be read and written using the variable areas of the E5AR-T/ER-T.

Operation commands do not use the variable areas.

A variable area is accessed by specifying the position of a variable within the variable area using the channel identifier, area number, and address in the area.

## Addresses

Addresses are allocated within each variable type. Addresses are two bytes long and written in hexadecimal. Addresses are allocated according to access size. Each address consists of a channel identifier, area number, and the address in the area.

Area numbers in the variable area are listed in the following table.

| Variable <br> type | Description | Area |
| :---: | :--- | :---: |
| 04 | Communications Monitor |  |
| 05 | Protect Level |  |
| 06 | Operation Level |  |
| 07 | Adjustment Level |  |
| 08 | Adjustment 2 Level | Setting area 0 <br> (Operation in <br> progress.) |
| 09 | Alarm Set Setting Level |  |
| 0 A | PID Setting Level |  |
| $0 B$ | Approximation Setting Level |  |
| 18 | Program Setting Level |  |
| 19 | Time Signal Setting Level |  |

| Variable <br> type | Description | Area |
| :---: | :--- | :---: |
| OC | Input Initial Setting Level |  |
| OD | Control Initial Setting Level |  |
| OE | Control Initial Setting 2 Level |  |
| OF | Alarm Setting Level | Setting area 1 <br> (Operation stopped.) |
| 10 | Display Adjustment Level |  |
| 11 | Communications Setting Level |  |
| 12 | Advanced Function Setting Level |  |
| 13 | Expansion Control Setting Level |  |

## - Channel Identifier

## - Address in Area

To specify channels 2 to 4 for Controllers with more than one input channel, specify a channel identifier between 1 and 3 to identify the channel. Only 0 (channel 1 ) can be specified for controllers with only one input channel.

| Channel identifier | Channel |
| :---: | :---: |
| 0 | Channel 1 |
| 1 | Channel 2 |
| 2 | Channel 3 |
| 3 | Channel 4 |

This address is allocated a parameter in the variable areas. Addresses are assigned in order beginning from the first parameter.
For more information on addresses, refer to Appendix Setting Lists ( P . A-6).
The addresses indicated in the setting list are the addresses for channel 1. To specify an address of channel 2, for example, add H'4000 to the address in the setting list. For channel 3, add H'8000, and for channel 4, add H'C000.

## ■ Number of Elements

The number of elements is expressed as a 2-byte hexadecimal number. For example, if the number of elements is 0010 , the first 8 elements of data ( $\mathrm{H}^{\prime} 10$ ) from the address are specified.
The specification range for the number of elements depends on the command. Refer to 7.9 Commands and Responses (P. 7-20) for more information.

In the Modbus protocol one element is two bytes of data, however, set values in the E5AR-T/ER-T are four bytes each.

## Set Values

Values read and written to the variable area are expressed in hexadecimal and disregard the decimal point position. Negative values are expressed as a two's complements.
Example: D'105.0 $\rightarrow$ H'0000041A
This variable is an 8 -digit number in hexadecimal. Negative values are expressed as a two's complement. The decimal is disregarded. If the PV of the E5AR-T/ER-T is 105.0 , it will be read as $\mathrm{H}^{\prime} 0000041 \mathrm{~A}\left(105.0 \rightarrow 1050 \rightarrow \mathrm{H}^{\prime} 0000041 \mathrm{~A}\right)$. If data that uses the program time unit is read and is displayed as 99.59, the read data will be H'000026E7 $(99.59 \rightarrow 9959 \rightarrow$ H'000026E7).

### 7.5 Read from Variable Area

Read from a variable area by setting the required data in the following command frame.

## Command

Command Frame

| Data name | Description |
| :--- | :--- |
| Slave address | Specify the unit number of the E5AR-T/ER-T. Set in <br> hexadecimal from H'01 to H'63 (1 to 99). |
| Function code | The function code for Read from Variable Area com- <br> mand is H'03. |
| Read start <br> address | Specify the address of the set value to read. For more <br> information on addresses, refer to Appendix Setting <br> Lists (P. A-6). |
| Number of <br> elements | Specify the number of set values to read times 2 for the <br> number of elements. The setting range is H'0002 to <br> H'006A (2 to 106). <br> Example: If the number of set values sets is 2, specify <br> H'0004. |
| CRC-16 | The check code calculated based on the values from the <br> slave address through the end of the data. For the calcu- <br> lation method, refer to Example of CRC-16 Calculation <br> in 7.2 Frames (P. 7-4). |

## Response Response Frame

| Data name | Description |
| :--- | :--- |
| Slave address | The value from the command frame is returned here. |
| Function code | The received function code is returned here. <br> In an error response frame, "H'80" is added to the <br> received function code to indicate that it is an error <br> response. <br> Example: Received function code $=H^{\prime} 03$ <br> Function code in error response frame $=H^{\prime} 83$ |
| Byte count | Number of bytes of data that were read. |
| Read data | The set value that was read. |
| CRC-16 | This is the check code calculated from the slave address <br> through the end of the data. For the calculation method, <br> refer to Example of CRC-16 Calculation in 7.2 Frames <br> (P. 7-4). |

## - Response Codes

| Function code | Error code | Error name | Cause |
| :---: | :---: | :---: | :---: |
| H'83 | H'02 | Variable address error | Error in the read start address. |
|  | H'03 | Variable data error | The number of elements exceeds the specified range. |
|  | H'04 | Operation error | Unit error, unit change, display unit error, or EEPROM error (does not occur when number of elements is 0 ). |
| H'03 | - | Normal end | No error. |

## - Reading Non-display Data

Set values can be read even if the parameters are set not to be displayed or are not displayed due to the model.

## Command/Response Example

Reading the PV of Channel 1
(Slave address: H'01)
PV of channel 1 (read-only data)
Address: H'0404
Data read: H'000003E8 $\left(100.0^{\circ} \mathrm{C}\right)$
Command: 010304040002 (CRC-16)
Response: 01030400003 E8 (CRC-16)

### 7.6 Write to Variable Area

Write to a variable area by setting the required data in the following command frame.

## Command

## Command Frame

| Data name | Description |
| :--- | :--- |
| Slave address | Specify the unit number of the E5AR-T/ER-T. Set in <br> hexadecimal from H'01 to H'63 (1 to 99). |
| Function code | The function code for the Write to Variable Area com- <br> mand is H' 10. |
| First address of <br> write | Specify the address of the set value to write. <br> For more information on addresses, refer to Appendix <br> Setting Lists (P. A-6). |
| Number of <br> elements | Specify the number of set values to write times 2 for the <br> number of elements. The setting range is H'0002 to <br> H'0068 (2 to 104). <br> Example: When the number of set values is 2, specify <br> H'0004. |
| Byte count | Specify the number of bytes of data to write. |

## Response Response Frame

| Data name | Description |
| :--- | :--- |
| Slave address | The value from the command frame is returned here. |
| Function code | The received function code is returned here. <br> In an error response frame, "H'80" is added to the <br> received function code to indicate that it is an error <br> response. <br> Example: Received function code = H'10 <br> Function code in error response frame = H'90 |
| Write start <br> address | The write start address that was received is returned <br> here. |
| Number of <br> elements | The received number of elements. <br> CRC-16This is the check code calculated from the slave address <br> through the end of the data. For the calculation method, <br> refer to Example of CRC-16 Calculation in 7.2 Frames <br> (P. 7-4). |

## - Response Codes

| Function code | Error code | Error name | Cause |
| :---: | :---: | :---: | :---: |
| H'90 | H'02 | Variable address error | Error in write start address. |
|  | H'03 | Variable data error | - Number of elements and number of data items do not agree. <br> - Number of elements times 2 does not agree with byte count. <br> - Write data exceeds the setting range. |
|  | H'04 | Operation error | The operating status does not permit writing. The settings for the write data are not permitted in the current operating mode. <br> - The communications writing function is disabled. <br> - Attempted to write to set values in setting area 1 from setting area 0 . <br> - Attempted to write to Protect Level set values from another level. <br> - AT is being executed. <br> - The program number was changed during programmed operation. <br> - User calibration is in progress. <br> - Unit error, unit change, display unit error, or EEPROM error. |
| H'10 | - | Normal end | No error |

## - Writing Non-display Data

It is possible to write set values even if they are set to not be displayed or are not displayed due to the model. Exercise caution when writing continuously.

## Command/Response Example

Writing the SP Setting Upper Limit and SP Setting Lower Limit parameters in the Control Initial Setting Level for channel 1. (Slave address: H'01)

SP Setting Upper Limit for Channel 1
Address: H'0D1E
Data written: H'00002710 ( $1000.0^{\circ} \mathrm{C}$ )
SP Setting Lower Limit for Channel 1
Address: H'0D20
Data written: H'FFFFFC18 ( $-100.0^{\circ} \mathrm{C}$ )
Command: 0110 OD 1E 00040800002710 FF FF FC 18 (CRC-16)
Response: 01000000 1E 0004 (CRC-16)

### 7.7 Operation Commands

Operation commands are sent using the following command frame.
Command
Command Frame

| Data name | Description |
| :--- | :--- |
| Slave address | Specify the unit number of the E5AR-T/ER-T. Set in <br> hexadecimal from H'01 to H'63 (1 to 99). |
| Function code | The function code for an Operation Command is H'06. |
| Write start <br> address | Specify H'0000 for the Operation Command address. |
| Write data | Enter the operation code of the operation command <br> and related information (see table below). |
| CRC-16 | This is the check code calculated from the slave <br> address through the end of the data. For the calcula- <br> tion method, refer to Example of CRC-16 Calculation <br> in 7.2 Frames (P. 7-4). |

Operation Commands for the E5AR-T/ER-T are listed in the following table.

| Operation code | Description | Related information |  |
| :---: | :---: | :---: | :---: |
|  |  | Upper Byte | Lower Byte |
| H'00 | Communications Writing | $\mathrm{H}^{\prime} 0$ * | H'0: OFF (disabled) <br> H'1: ON (enabled) |
| H'01 | Run/Reset | H'0 to 3, F *2 | H'0: Run, H'1: Reset |
| H'03 | AT Execute | H'0 to 3, F *2 | H'0: Current PID set number H'1 to 8: PID set number |
| H'04 | Write Mode | $\mathrm{H}^{\prime} \mathrm{O}$ * | H'0: Backup Mode <br> H'1: RAM Write Mode |
| H'05 | Save RAM <br> Data | $\mathrm{H}^{\prime} \mathrm{O}$ * | $\mathrm{H}^{\prime} \mathrm{O}$ |
| H'06 | Software Reset | $\mathrm{H}^{\prime} \mathrm{O}$ * | $\mathrm{H}^{\prime} \mathrm{O}$ |
| H'07 | Move to Setting Area 1 | $\mathrm{H}^{\prime} 0$ * | $\mathrm{H}^{\prime}$ |
| H'08 | Move to Protect Level | $\mathrm{H}^{\prime} \mathrm{O}^{* 1}$ | $\mathrm{H}^{\prime} \mathrm{O}$ |
| H'09 | Auto/Manual | H'0 to 3, F *2 | H'0: Auto Mode <br> H'1: Manual Mode |
| H'OA | AT Cancel | H'0 to 3, F *2 | H'0: Cancel |
| H'OB | Parameter Initialization | $\mathrm{H}^{\prime} \mathrm{*}^{*}$ | $\mathrm{H}^{\prime} \mathrm{O}$ |

| Operation <br> code | Description | Related information |  |
| :--- | :--- | :--- | :--- |
|  | Upper Byte | Lower Byte |  |
| H'0C | Alarm Latch <br> Cancel | H'0 to 3, F *2 $^{\text {H'0 }}$ |  |
| H'0D | SP Mode | H'0 to 3, F *2 $^{\text {H'0: PSP, H'1: RSP, H'2: FSP }}$ |  |
| H'12 | Hold | H'0 to 3, F *2 $^{\text {H'0: Hold Cancel }}$H'1: Hold <br> H'13 | Advance |
| H'0 to 3, F *2 | H'0 |  |  |
| H'14 | Back | H'0 to 3, F *2 $^{\text {H'0 }}$ |  |

*1: Executed for all channels.
*2: Specify the channel.
0: CH1, 1: CH2, 2: CH3, 3: CH4, F: All channels
Note:When all channels is specified, only enabled channels will respond and processing will begin from channel 1. If an error is detected on any one channel, an operation error will occur. If all channels end normally, a normal end will occur.

## Response Frame

| Data name | Description |
| :--- | :--- |
| Slave address | The value from the command frame appears here. |
| Function code | This is the received function code. <br> In an error response frame, "H'80" is added to the <br> received function code to indicate that it is an error <br> response. <br> Example: Received function code $=$ H'06 <br> Function code in error response frame $=H^{\prime} 86$ |
| Beginning <br> address of write | Beginning address of write that was received. |
| Written data | Received operation command data. |
| CRC-16 | This is the check code calculated from the slave address <br> through the end of the data. For the calculation method, <br> refer to Example of CRC-16 Calculation in 7.2 Frames <br> (P. 7-4). |

## - Response Codes

| Function <br> code | Error <br> code | Error name | Cause |
| :---: | :---: | :--- | :--- |
|  | H'02 | Variable <br> address error | The variable address is not H'0000. |
|  | H'03 | Variable data <br> error | Error in written data. <br> • Incorrect operation code or related <br> information. |
|  | H'04 | Operation <br> error | The operating status does not permit <br> writing. <br> - The communications writing func- <br> tion is disabled. The command will <br> be received even if the communica- <br> tions writing function is disabled. <br> • Cannot process. <br> See description of commands in 7.9 <br> Commands and Responses (P. 7- <br> 20). <br> - Unit error, unit change, display unit <br> error, or EEPROM error. |
| H'06 | - | Normal end | No error |

## Command/Response Example

Operation Command to Channel 2 (slave address: H'01)
Channel 2 Operation Command
Address: H'0000
Written data: H'0111 (Reset command to channel 2)
$\begin{array}{lllllll}\text { Command: } & 01 & 06 & 0000 & 0111 & (\text { (CRC-16) } \\ \text { Response: } & 01 & 06 & 0000 & 0111 & \text { (CRC-16) }\end{array}$

### 7.8 Setting Areas

The E5AR-T/ER-T has two setting areas for communications: Setting area 0 and setting area 1.
In setting area 0 , operation continues. Setting area 0 makes it possible to perform operations that require operation to be in progress, such as reading the PV, writing an SP, and starting/resetting operation (Run/ Reset), as well as operations that do not interfere with control. On the other hand, operations that may change control, such as writing Initial set values, cannot be performed. (Set values that cannot be written can still be read.)

In setting area 1, operation is stopped. This makes it possible to perform operations such as writing Initial set values, which cannot be written in setting area 0.
When the power is turned ON, setting area 0 is selected. To access setting area 1, use the Move to Setting Area 1 operation command. To return to setting area 0 from setting area 1 , turn OFF the power or use the Software Reset operation command.

| Area <br> number | Description | Area |
| :--- | :--- | :---: |
| 04 | Communications Monitor |  |
| 05 | Protect Level |  |
| 06 | Operation Level | Setting area 0 <br> (Operation in <br> progress.) |
| 07 | Adjustment Level |  |
| 08 | Adjustment 2 Level |  |
| 09 | Alarm Set Setting Level |  |
| 0 A | PID Setting Level |  |
| OB | Approximation Setting Level |  |
| 18 | Program Setting Level |  |
| 19 | Time Signal Setting Level |  |

| Area <br> number | Description | Area |
| :--- | :--- | :---: |
| OC | Input Initial Setting Level |  |
| OD | Control Initial Setting Level |  |
| $0 E$ | Control Initial Setting 2 Level |  |
| OF | Alarm Setting Level | Setting area 1 <br> (Operation stopped.) |
| 10 | Display Adjustment Level |  |
| 11 | Communications Setting Level |  |
| 12 | Advanced Function Setting Level |  |
| 13 | Expansion Control Setting Level |  |

### 7.9 Commands and Responses

The E5AR-T/ER-T provides a set of commands that read from variable areas, write to variable areas, execute operation commands, and execute other services provided by the Modbus communications protocol. The commands supported by the E5AR-T/ER-T are described below.

## Reading Monitor Values

## Command

| Address | Monitor value |  | Address | Monitor value |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Ch | Data name |  | Ch | Data name |
| H'0404 | 1 | PV | H'8404 | 3 | PV |
| H'0406 |  | Present Set Point | H'8406 |  | Present Set Point |
| H'040A |  | PID Set Number Monitor | H'840A |  | PID Set Number Monitor |
| H'040C |  | Status | H'840C |  | Status |
| H'040E |  | Program Status | H'840E |  | Program Status |
| H'0410 |  | Alarm Set Number Monitor | H'8410 |  | Alarm Set Number Monitor |
| H'4404 | 2 | PV | H'C404 | 4 | PV |
| H'4406 |  | Present Set Point | H'C406 |  | Present Set Point |
| H'440A |  | PID Set Number Monitor | H'C40A |  | PID Set Number Monitor |
| H'440C |  | Status | H'C40C |  | Status |
| H'440E |  | Program Status | H'C40E |  | Program Status |
| H'4410 |  | Alarm Set Number Monitor | H'C410 |  | Alarm Set Number Monitor |

This command is used to read the present values, status, and other monitor values. The number of elements can be set from H'0004 to 006A (4 to 106) to allow reading monitor values in consecutive addresses.

When used in setting area 1, the response for the present value and internal SP will be 0 and the response for the status will be as indicated in the notes in E5 $\square R-T$ Status (Communications) in Appendix Setting Lists (P. A-8).

The response for a normal end is shown above. For information on error responses, refer to 7.5 Read from Variable Area (P. 7-11).

Reading Set Values

## Command

| Address | Description |  |
| :---: | :---: | :---: |
|  | Ch |  |
|  | 1 | Set values in setting area 0 |
| H'0600 to 061C |  | Operation Level |
| H'0700 to 074A |  | Adjustment Level |
| H'0800 to 0818 |  | Adjustment 2 Level |
| H'0900 to 096E |  | Alarm Set Setting Level |
| H'0A00 to 0A9E |  | PID Setting Level |
| H'0B00 to 0B6E |  | Approximation Setting Level |
| H'1800 to 183A |  | Program Setting Level |
| H'1900 to 196C |  | Time Signal Setting Level |
|  |  | Set values in setting area 1 |
| H'0C00 to 0C20 |  | Input Initial Setting Level |
| H'0D00 to OD36 |  | Control Initial Setting Level |
| H'0E00 to 0E76 |  | Control Initial Setting 2 Level |
| H'0F00 to OF2C |  | Alarm Setting Level |
| H'1000 to 100E |  | Display Adjustment Level |
| H'1100 to 110C |  | Communications Setting Level |
| H'1200 to 1218 |  | Advanced Function Setting Level |
| H'1300 to 133A |  | Expansion Control Setting Level |
| H'4000 added to above addresses | 2 | Same set values as channel 1 |
| H'8000 added to above addresses | 3 | Same set values as channel 1 |
| H'C000 added to above addresses | 4 | Same set values as channel 1 |

This command is used to read set values. The number of elements can be set from H'0004 to 006A (4 to 106) to allow successive reading of 2 to 53 set values in consecutive addresses.
To specify the variable type or address, refer to Appendix Setting Lists (P. A-6). The upper limit of an address depends on the variable type.

This command can be used in both setting area 0 and setting area 1. When used in setting area 1, the response for the remote SP monitor, ramp SP monitor, and valve opening monitor will be 0 and the response for the status will be as indicated in the notes in E5 $\square R-T$ Status (Communications) in Appendix Setting Lists (P. A-8).

The response for a normal end is shown above. For information on error responses, refer to 7.5 Read from Variable Area (P. 7-11).

## Writing Set Values in Protect Level

Command

| Address | Parameter |
| :---: | :--- |
| H'0500 | Operation Adjustment Protection |
| H'0502 | Initial Setting Protection |
| H'0504 | Setting Change Protection |
| H'0506 | PF Key Protection |

This command writes set values in the Protect Level. Refer to 4.1 Setting Levels and Key Operations (P. 4-2) for information on Protect Level.

This command is used in setting area 0 . If used in setting area 1 , an error will result.

To use this command, first enable using the communications writing function by executing the Communications Writing operation command, and then move to Protect Level by executing the Move to Protect Level operation command.

## Response

The response for a normal end is shown above. For information on error responses, refer to 7.6 Write to Variable Area (P. 7-13).

## Writing Set Values

| Address | Description |  |
| :---: | :---: | :---: |
|  | Ch |  |
|  | 1 | Set values in setting area 0 |
| H'0600 to 061C |  | Operation Level |
| H'0700 to 074A |  | Adjustment Level |
| $\mathrm{H}^{\prime} 0800$ to 0818 |  | Adjustment 2 Level |
| H'0900 to 096E |  | Alarm Set Setting Level |
| H'0A00 to 0A9E |  | PID Setting Level |
| H'0B00 to 0B6E |  | Approximation Setting Level |
| H'1800 to 183A |  | Program Setting Level |
| H'1900 to 196C |  | Time Signal Setting Level |
|  |  | Set values in setting area 1 |
| H'0C00 to 0C20 |  | Input Initial Setting Level |
| H'0D00 to 0D36 |  | Control Initial Setting Level |
| H'0E00 to 0E76 |  | Control Initial Setting 2 Level |
| H'0F00 to OF2C |  | Alarm Setting Level |
| H'1000 to 100E |  | Display Adjustment Level |
| H'1100 to 110C |  | Communications Setting Level |
| H'1200 to 1218 |  | Advanced Function Setting Level |
| H'1300 to 133A |  | Expansion Control Setting Level |
| H'4000 added to above addresses | 2 | Same set values as channel 1 |
| H'8000 added to above addresses | 3 | Same set values as channel 1 |
| H'C000 added to above addresses | 4 | Same set values as channel 1 |

This command is used to write set values. The number of elements can be set from H'0004 to 0068 (4 to 104) to write from 2 to 52 set values at consecutive addresses.

To specify the variable type and address, refer to Appendix Setting Lists (P. A-6).

Parameters in setting area 1 can be written from setting area 1. An operation error will occur if parameters are written from setting area 0.

To use this command, the communications writing function must be enabled using the Communications Writing operation command.
To store the set values for Operation or Adjustment Level in EEPROM, select "Backup Mode" and execute the RAM Write Mode command. If "Backup Mode" is not selected, the set values will not remain in memory when the power is turned OFF. For more information on the above levels, refer to 4.1 Setting Levels and Key Operations (P. 4-2).

The response for a normal end is shown above. For information on error responses, refer to 7.6 Write to Variable Area (P. 7-13).

## Communications Writing

| Related <br> information | Description |
| :---: | :---: |
| H'$^{\prime} 00$ | Communications Writing Disabled |
| H'$^{\prime} 01$ | Communications Writing Enabled |

This command is used to enable or disable the communications writing function. It changes the setting of the Communications Writing parameter.

When the communications writing function is disabled, communications cannot be used to write set values or send operation commands, such as the Run/Reset operation command.

## The default setting is "Communications Writing Disabled."

This command can be used in both setting area 0 and setting area 1.

The response for a normal end is shown above. For information on error responses, refer to 7.7 Operation Commands (P. 7-15).

## Run/Reset

Command

| Related information | Description |  |
| :---: | :---: | :---: |
|  | Ch | Control state |
| H'00 |  | Run |
| H'01 |  | Reset |
| H'10 |  | Run |
| H'11 |  | Reset |
| H'20 |  | Run |
| H'21 |  | Reset |
| H'30 |  | Run |
| H'31 |  | Reset |
| H'F0 |  | Run |
| H'F1 |  | Reset |

This command is used to start or reset control.
This command is used in setting area 0.
When the control mode is set to cascade control, perform the Run/ Reset operation command for channel 2.
If "All" is selected for the channel, only the channels that are enabled will be affected by this command.

To use this command, the communications writing function must be enabled using the Communications Writing operation command.

The response for a normal end is shown above. For information on error responses, refer to 7.7 Operation Commands (P. 7-15).

## AT Execute

## Command

| Related information | Description |  |
| :---: | :---: | :---: |
|  | Ch | Command mode |
| H'00 to 08 | 1 | 00: Current PID set number 01 to 08 : PID set number 1 to 8 |
| H'10 to 18 | 2 | 10: Current PID set number <br> 11 to 18 : PID set number 1 to 8 |
| H'20 to 28 | 3 | 20: Current PID set number <br> 21 to 28 : PID set number 1 to 8 |
| H'30 to 38 | 4 | 30: Current PID set number <br> 31 to 38 : PID set number 1 to 8 |
| H'F0 to F8 | All | F0: Current PID set number F1 to F8: PID set number 1 to 8 |

This command executes AT. On the E5AR-T/ER-T, the PID set number must be specified when executing AT.

To specify the current PID set number (the PID set currently used for operation), set the lower byte of the related information to 0 .

This command is used in setting area 0 . An operation error will occur if it is used in setting area 1. An operation error will also occur in the following cases:

- If the Run/Reset parameter is set to "Reset" for the specified channel
- If the Auto/Manual parameter is set to "Manual" for the specified channel
To use this command, the communications writing function must be enabled using the Communications Writing operation command.

Response

The response for a normal end is shown above. For information on error responses, refer to 7.7 Operation Commands (P. 7-15).

## ■ AT Cancel

## Command

| Related <br> information | Description |  |
| :---: | :---: | :---: |
|  | Ch | Command mode |
| H'00 $^{\prime} 0$ | 1 | AT Cancel |
| H'10 $^{\prime} 10$ | 2 | AT Cancel |
| H'20 $^{\prime}$ | 3 | AT Cancel |
| H'30 $^{\prime} 3$ | 4 | AT Cancel |
| H'F0 | All | AT Cancel |

This command cancels AT.
This command is used in setting area 0 . An operating error will occur if it is used in setting area 1. An operation error will also occur in the following cases:

- If the Run/Reset parameter is set to "Reset" for the specified channel
- If the Auto/Manual parameter is set to "Manual" for the specified channel
To use this command, the communications writing function must be enabled using the Communications Writing operation command.

## Response

The response for a normal end is shown above. For information on error responses, refer to 7.7 Operation Commands (P. 7-15).

## Write Mode

| Related <br> information | Description |
| :---: | :--- |
| H'00 $^{\prime} 00$ Backup Mode |  |
| H'01 $^{\prime} 01$ | RAM Write Mode |

This command is used to select the Backup Mode or RAM Write Mode.

## The default setting is "Backup Mode."

This command can be used in both setting area 0 and setting area 1.

To use this command, the communications writing function must be enabled using the Communications Writing operation command.

| Write mode | Description |
| :---: | :--- |
| Backup Mode | When communications are used to write set values in <br> the Operation, Program Setting, Adjustment, Adjust- <br> ment 2, Alarm Set Setting, PID Setting, Time Signal <br> Setting, or Approximation Setting Level, the data is <br> also written to EEPROM. |
| When communications are used to write set values in <br> the Operation, Program Setting, Adjustment, Adjust- <br> ment 2, Alarm Set Setting, PID Setting, Time Signal <br> Setting, or Approximation Setting Level, the data is <br> not written to EEPROM. <br> When SP tracking or PV tracking is ON and the mode <br> is changed to Remote SP Mode or Manual Mode, the <br> SP is not written to EEPROM. <br> When a change is made to a parameter setting using <br> a key operation, the data is written to EEPROM. |  |

When the write mode is changed from RAM Write Mode to Backup Mode, the set values in the Operation, Program Setting, Adjustment, Adjustment 2, Alarm Set Setting, PID Setting, Time Signal Setting, and Approximation Setting Levels are written to EEPROM. Each level is described in 4.1 Setting Levels and Key Operations (P. 4-2).
The time required for RAM backup depends on the num-
ber of settings that were changed in RAM Backup Mode.
The more settings that were changed, the longer the time
required. For example, if all settings in Operation, Pro-
gram Setting, Adjustment, Adjustment 2, Alarm Set Set-
ting, PID Setting, Time Signal Setting, and Approximation
Levels were changed, the most time would be required,
which is about 5 seconds.

## Response

The response for a normal end is shown above. For information on error responses, refer to 7.7 Operation Commands (P. 7-15).

## Save RAM Data

This command writes the set values in the Operation and Adjustment Levels to EEPROM. Operation and Adjustment Levels are described in 4.1 Setting Levels and Key Operations (P. 4-2).

This command can be used in both setting area 0 and setting area 1.
To use this command, the communications writing function must be enabled using the Communications Writing operation command.

The response for a normal end is shown above. For information on error responses, refer to 7.7 Operation Commands (P. 7-15).

## Software Reset

> Command

A software reset causes the same operation as turning the power OFF and ON.

This command can be used in both setting area 0 and setting area 1.
To use this command, the communications writing function must be enabled using the Communications Writing operation command.

The response for a normal end is shown above. For information on error responses, refer to 7.7 Operation Commands (P. 7-15).

## Move to Setting Area 1

Command

Use this command to move to setting area 1.
The command is used in setting area 0 . Nothing happens if the command is used in setting area 1.

If the command is used when the Initial Setting Protection parameter is set to 2 (Disable Move to Input Initial Setting Level), an operation error will occur.

To use this command, the communications writing function must be enabled using the Communications Writing operation command.

The response for a normal end is shown above. For information on error responses, refer to 7.7 Operation Commands (P. 7-15).

## ■ Move to Protect Level

## Command

Use this command to move to Protect Level. Protect Level is described in 4.1 Setting Levels and Key Operations (P. 4-2).

This command is used in setting area 0 . If used in setting area 1 , an operation error will result.

To use this command, the communications writing function must be enabled using the Communications Writing operation command.

## Response

The response for a normal end is shown above. For information on error responses, refer to 7.7 Operation Commands (P. 7-15).

## Auto/Manual

| Related information | Description |  |
| :---: | :---: | :---: |
|  | Ch | Command mode |
| H'00 | 1 | Auto |
| H'01 |  | Manual |
| H'10 | 2 | Auto |
| H'11 |  | Manual |
| H'20 | 3 | Auto |
| H'21 |  | Manual |
| H'30 | 4 | Auto |
| H'31 |  | Manual |

| Related <br> information | Description |  |
| :---: | :---: | :---: |
|  | Ch | Command mode |
| H'F0 | All | Auto |
| H'F1 |  | Manual |

Use this command to select automatic or manual operation.
This command is used in setting area 0 . If used in setting area 1 , an operation error will result.
To use this command, the communications writing function must be enabled using the Communications Writing operation command.
When the control mode is set to cascade control, perform the Auto/ Manual operation command for channel 2.

Response

The response for a normal end is shown above. For information on error responses, refer to 7.7 Operation Commands (P. 7-15).

## Parameter Initialization

## Command

This command returns all settings to the default settings.
This command is used in setting area 1 . If used in setting area 0 , an operation error will result.
To use this command, the communications writing function must be enabled using the Communications Writing operation command.

The response for a normal end is shown above. For information on error responses, refer to 7.7 Operation Commands (P. 7-15).

## Alarm Latch Cancel

## Command

| Related <br> information | Description |  |
| :---: | :---: | :---: |
|  | Ch | Command mode |
| H'00 $^{\prime} 0$ | 1 | Alarm Latch Cancel |
| H'10 $^{\prime} 10$ | 2 | Alarm Latch Cancel |
| H'20 | 3 | Alarm Latch Cancel |
| H'30 $^{\prime}$ | 4 | Alarm Latch Cancel |
| H'F0 | All | Alarm Latch Cancel |

This command cancels alarm latch. The command is used when the alarm latch function is in use.
This command can be used in both setting area 0 and setting area 1.
If AT is being executed for the specified channel, an operation error will occur.
To use this command, the communications writing function must be enabled using the Communications Writing operation command.

## Response

The response for a normal end is shown above. For information on error responses, refer to 7.7 Operation Commands (P. 7-15).

SP Mode

Command

| Related information | Description |  |
| :---: | :---: | :---: |
|  | Ch | Command mode |
| "00" | 1 | Program SP |
| "01" |  | Remote SP |
| "02" |  | Fixed SP |
| "10" | 2 | Program SP |
| "11" |  | Remote SP (Close Cascade) |
| "12" |  | Remote SP (Open Cascade) |
| "21" | 3 | Remote SP |
| "22" |  | Fixed SP |

| Related <br> information | Description |  |
| :---: | :---: | :---: |
|  | Ch | Command mode |
| "31" | 4 | Remote SP |
| "32" |  | Fixed SP |
| "F1" | All | Remote SP |
| "F2" |  | Fixed SP |

Use this command to select the SP Mode. Refer to SP Modes in 5.7 Program Operation Functions (P. 5-31) for details on the SP Mode.
This command can be used in both setting area 0 and setting area 1.
If AT is being run in the specified channel, an operation error will occur.
To use this command, the communications writing function must be enabled using the Communications Writing operation command.

## Response

| Slave address | Function code | Write start address |  |  | Operation code |  | CRC-16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | H'06 | $\mathrm{H}^{\prime} \mathrm{OO}$ |  |  | $\mathrm{H}^{\prime} \mathrm{OD}$ |  | , |
| 1 | 1 |  | 2 |  |  | 2 | 2 |

The response for a normal end is shown above. For information on error responses, refer to 7.7 Operation Commands (P. 7-15).

| Related information | Description |  |
| :---: | :---: | :---: |
|  | Ch | Command mode |
| "00" |  | Hold Cancel |
| "01" |  | Hold |
| "10" |  | Hold Cancel |
| "11" |  | Hold |
| "20" |  | Hold Cancel |
| "21" |  | Hold |
| "30" |  | Hold Cancel |
| "31" |  | Hold |
| "F0" |  | Hold Cancel |
| "F1" |  | Hold |

This command starts or cancels the hold operation.
This command is used in setting area 0 . An operation error will occur if it is used is setting area 1.

Operation errors will also occur in the following cases:

- If $A T$ is being executed
- If the specified channel is being reset or is on standby

To use this command, the communications writing function must be enabled using the Communications Writing operation command.

The response for a normal end is shown above. For information on error responses, refer to 7.7 Operation Commands (P. 7-15).

## Advance

| Related <br> information | Description |  |
| :---: | :---: | :---: |
|  | Ch | Command mode |
| "00" | 1 | Advance |
| "10" | 2 | Advance |
| "20" | 3 | Advance |
| "30" | 4 | Advance |
| "F0" | All | Advance |

This command executes an advance operation. Operation will move to the beginning of the next segment.
This command is used in setting area 0 . An operation error will occur if it is used in setting area 1.

Operation errors will also occur in the following cases:

- If $A T$ is being executed
- If the specified channel is being reset or is on standby

To use this command, the communications writing function must be enabled using the Communications Writing operation command.

The response for a normal end is shown above. For information on error responses, refer to 7.7 Operation Commands (P. 7-15).

## Back

## Command

| Related <br> information | Description |  |
| :---: | :---: | :---: |
|  | Ch | Command mode |
| "00" | 1 | Back |
| "10" | 2 | Back |
| "20" | 3 | Back |
| "30" | 4 | Back |
| "F0" | All | Back |

This command executes a back operation. Operation will move to the beginning of the current segment.

This command is used in setting area 0 . An operation error will occur if it is used in setting area 1.
Operation errors will also occur in the following cases:

- If AT is being executed
- If the specified channel is being reset or is on standby

To use this command, the communications writing function must be enabled using the Communications Writing operation command.

## Response

The response for a normal end is shown above. For information on error responses, refer to 7.7 Operation Commands (P. 7-15).

## Echoback Test

This command is used to perform an echoback test.
The command can be used in any state of the E5AR-T/ER-T.
The test data can be any two bytes of hexadecimal data.

## Response

The response for a normal end is shown above. For information on error responses, refer to 7.7 Operation Commands (P. 7-15).

## Section 8 Parameters

8.1 Using this Section ..... 8-2
8.2 Protect Level (1, Pr-t) ..... 8-3
8.3 Operation Level ( ) ..... 8-6
8.4 Program Setting Level ( ) ..... 8-16
8.5 Adjustment Level (2. Rád) ..... 8-22
8.6 Adjustment 2 Level (2. Hader $^{2}$ ) ..... 8-33
8.7 Alarm Set Setting Level ( $\boldsymbol{2} \boldsymbol{H} \boldsymbol{H} \boldsymbol{H}$ ..... 8-36
8.8 PID Setting Level (as) ..... 8-39
8.9 Time Signal Setting Level ( ) ..... 8-43
8.10 Approximation Setting Level (LEEK) ..... 8-46
8.11 Input Initial Setting Level (i) ..... 8-49
8.12 Control Initial Setting Level (1. i i) ..... 8-55
8.13 Control Initial Setting 2 Level ( $1 . \mathcal{E}^{\prime}$ ) ..... 8-63
8.14 Alarm Setting Level (2.3) ..... 8-74
8.15 Display Adjustment Level ( $\mathbf{2} .4$. 4 ) ..... 8-80
8.16 Communications Setting Level (2.5). ..... 8-84
8.17 Advanced Function Setting Level (L. FaF) ..... 8-88
8.18 Expansion Control Setting Level (ELG) ..... 8-94

### 8.1 Using this Section

## - Marks Used in this Section

Indicates the description of the meaning and function of the parameter.

Indicates the setting range and initial setting of the parameter.

Setting

Indicates parameters used for monitor values.

Monitor

Indicates the description of a procedure for operating the E5AR-T/ERT.

Operation

Indicates where a parameter is described and notes related to parameters.

## - Conditions for Displaying Parameters

A parameter will only appear on the display of the E5AR-T/ER-T when the conditions for use of the parameter are satisfied. (Conditions for use are indicated to the right of the parameter name.) Protected parameters, however, are not displayed regardless of the conditions for use, although they are in effect.

For parameters that can be set separately for each channel on a Controller with more than one input, CH appears to upper left of the parameter in this section.

### 8.2 Protect Level (2, ロー!)

Protect Level consists of four types of protection: Operation Adjustment Protection, Initial Setting Protection, Setting Change Protection, and PF Key Protection. Each is used to protect the corresponding settings and prevent accidental changes to the settings.

## - Level Changes at Startup Up To Protect Level

- Parameter Changes within Protect Level

| Operation Adjustment Protection | GRPL | LPrem |
| :---: | :---: | :---: |
| Initial Setting Protection | $\therefore \mathrm{CH}$ |  |
| Setting Change Protection | UEPE |  |
| PF Key Protection | PFPE |  |

The parameters that are protected are indicated below. Default settings are shaded.

- Operation Adjustment Protection

This function restricts key operation in Operation Level, Program Setting Level, Adjustment Level, Adjustment 2 Level, Alarm Set Setting Level, PID Setting Level, Time Signal Setting Level, Approximation Setting Level, and Monitor Item Level.

| Set value | Operation Level |  | Program Setting Level, Adjustment Level, and Adjustment 2 Level | Alarm Set Setting <br> Level, PID Setting Level, Time Signa Setting Level, Approximation Level and Monitor Item Level |
| :---: | :---: | :---: | :---: | :---: |
|  | PV, Fixed SP, or Program Number | Other |  |  |
| 0 | Enabled | Enabled | Enabled | Enabled |
| 1 | Enabled | Enabled | Enabled | Prohibited |
| 2 | Enabled | Enabled | Prohibited | Prohibited |
| 3 | Enabled | Prohibited | Prohibited | Prohibited |
| 4 | Restrictions* | Prohibited | Prohibited | Prohibited |

* The Program No. parameter is prohibited.

Enabled: No restrictions (Parameters can be displayed or changed, and the level can be entered.)
Restrictions: Some restrictions apply. (Parameters can be displayed but not changed.)
Prohibited: The parameters are completely protected. (Parameters cannot be displayed and the level can be entered.)

- Initial Setting Protection

Restricts movement to the Input Initial Setting Level, Control Initial Setting Level, Control Initial Setting 2 Level, Alarm Setting Level, Display Adjustment Level, and Communications Setting Level.

| Set <br> value | Move to Input Initial <br> Setting Level | Move to Control initial Setting, <br> Control Initial Setting 2, Alarm <br> Setting, Display Adjustment, and <br> Communications Setting Level |
| :--- | :--- | :--- |
| 0 | Enabled (displays <br> Advanced Function Set- <br> ting Level) | Enabled |
| 1 | Enabled (Does not <br> display Advanced <br> Function Setting Level) | Enabled |
| 2 | Prohibited | Prohibited |

- When the Initial Setting Protection parameter is set to 2, nothing happens when the Level Key is held down for 1 second or more to move to Input Initial Setting Level from Operation Level, Program Setting Level, Adjustment Level, Adjustment 2 Level, Alarm Set Setting Level, PID Setting Level, Time Signal Setting Level, Approximation Setting Level, or Monitor Item Level. (The display will also not flash to indicate the move.)

## - Setting Change Protection

Prevents use of the 人 and Keys.

| Set <br> value | Changing set values <br> using key operations | Exceptions |
| :--- | :--- | :--- |
| OFF | Enabled | - |
|  |  | • All parameters in Protect Level <br>  <br>  <br>  <br> - Move to Advanced Function Set- <br> ting Level |
| ON | Prohibited | Move to Calibration Level |
|  |  | • Program Editing |
|  |  | - Segment Editing |
|  |  | • Display Set Setting Level |
|  |  |  |

- The Setting Change Protection parameter is set to "OFF" by default.

## - PF Key Protection

Prevents use of the PF1 and PF2 Keys.

Setting

| Set <br> value | Changing set values using key operations |
| :--- | :--- |
| OFF | PF1/PF2 Keys are enabled |
| ON | PF1/PF2 Keys are disabled (operation as a function key and <br> channel key is disabled) |

- The PF Key Protection parameter is set to "OFF" by default.

### 8.3 Operation Level ( )

Display this level to operate the control system. The SP can be set and the PV monitored in this level.

- Level Changes at Startup Up To Operation Level

Parameter Changes within Operation Level

Manual MV $\quad$| rininit |
| ---: |

－This parameter sets the MV or valve opening during manual operation．On a Standard Control Model the MV is changed by pressing the 园 and Keys．On a Position－proportional Control Model，the 图 Key turns ON the open side and the $\mathbb{V}^{*}$ Key turns ON the close side．
－On a Standard Control Model，Display No． 1 shows the PV and Display No． 2 shows the MV．

MANU indicator lights．
When changed with the 人 and $\approx$ Keys，the MV is output once every 50 ms ．
－When a potentiometer is connected to a Position－proportional Control Model，Display No． 1 shows the PV and Display No． 2 shows the valve opening．When a potentiometer is not connected to a Position－proportional Control Model，Display No． 2 shows＂－－－－．＂

－In Manual Mode，operation is performed manually and the MANU indicator lights．
－The Manual Output Method parameter is used to select the MV that is used when entering Manual Mode．The MV prior to entering Manual Mode can be held，or the Manual MV Initial Value parameter can be used．
－Switching between Manual Mode and Auto Mode is accomplished using the PF Key，or with the Auto／Manual parameter in Operation Level．If either the PF1 Setting parameter or PF2 Setting parameter is set to＂A－M，＂the Auto／Manual parameter will not appear in Operation Level and only the PF Key is used for switching．
－Switching between Auto and Manual with a PF Key
To switch modes，hold down the PF Key for at least one second in Operation Level，Program Setting Level，Adjustment Level， Adjustment 2 Level，Alarm Set Setting Level，PID Setting Level， Time Signal Setting Level，Approximation Setting Level，Monitor Item Level，or Protect Level．

- Switching between Auto and Manual Using the Auto/Manual Parameter
To switch modes, change the setting of the Auto/Manual parameter in Operation Level.
- During cascade control, if the primary loop is switched to Manual Mode when the secondary loop is in any of the following conditions, the manual MV is disabled.
- The SP mode of the secondary loop is set to "Fixed SP" (cascade open).
- The secondary loop is in Manual Mode.
- The operation set to be performed at an error is being performed for the secondary loop.

- Standard Control Models

| Control method | Setting range | Unit | Default value |
| :--- | :--- | :--- | :--- |
| Standard | -5.0 to 105.0 | $\%$ | ${ }^{*} 1$ |
| Heating/cooling | -105.0 to 105.0 | $\%$ | ${ }^{*} 1$ |

*1 The Manual Output Method parameter (Expansion Control Setting Level) selects the MV that is used when Manual Mode is entered. The MV prior to entering Manual Mode can be held, or the Manual MV Initial Value parameter can be used.

- Position-proportional Control Models

| Control method | Monitor range | Unit |
| :--- | :--- | :--- |
| Position- <br> proportional | -10.0 to 110.0 | $\%$ |

## - Related Parameters

SP Upper Limit and SP Lower Limit (Control Initial Setting Level) (P. 8-57)
SP Mode (Adjustment Level) (P. 8-24)

- This parameter sets the number of the program to be executed.
- This parameter can be set only during a reset.

| Setting or monitor range | Unit | Default value |
| :--- | :--- | :--- |
| 1 to 32 (See note.) | --- | 1 |

Note:The range depends on the values set for the Independent Operation/Coordinated Operation parameter and Number of Segments parameter.

- Related Parameters

Independent Operation/Coordinated Operation (Control Initial Setting Level) (P. 8-59)
Number of Segments (Control Initial Setting Level) (P. 8-60)

- This parameter is used to hold the timer for program operation.
- The hold is cleared by executing a reset or executing a clear hold command.

- The hold is enabled when this parameter is set to ar.
- The default is $\mathbf{a r F}$ : Clear Hold.
- Related Information

Reference
5.7 Program Operation Functions (P. 5-28)

| CH | Holu |
| :---: | :---: |
| Advance | $\square$ |
|  |  |
|  | Running |

- This parameter is used to advance the program to the beginning of the next segment. If the advance operation is executed during a hold, the program is advanced to the beginning of the next segment and the hold status is continued.

Operation

- The set value is $\mathbf{a r F}$ when switching to this parameter.
- Change the set value to $\begin{array}{r}\text { ar to advance the program to the next }\end{array}$ segment.
- When the advance command execution has been completed, the set value will automatically return to $\overline{\operatorname{ar}} \boldsymbol{F} \boldsymbol{F}$.
- Related Information

Reference
5.7 Program Operation Functions (P. 5-28)

- This parameter is used to return the program to the start of the segment being executed. If the back operation is executed during a hold, the program returns to the beginning of the segment being executed and the hold status is continued.

- The set value is $\mathbf{a r F}$ when switching to this parameter.
- Change the set value to $\overline{\text { an }}$ to return to the beginning of the current segment.
- When the back command execution has been completed, the set value will automatically return to $\overline{\mathrm{G}} \boldsymbol{\mathrm { FF }}$.

### 8.5 Adjustment Level (2.

This level contains settings for adjusting control, such as auto-tuning (AT), enabling/disabling writing parameters with communications, changing the SP mode, adjusting hysteresis, and input correction settings.

## - Level Changes at Startup Up To Adjustment Level

- Parameter Changes within Adjustment Level

Note: Position-proportional Control Model: Completely Open/Hold/Completely Closed ( $-1 / 0 / 1$ )

$B L$
：Rid
Auto Mode，running
This parameter is used to execute auto－tuning（AT）．

Function

Operation
－When auto－tuning is executed，the MV is increased and decreased around the SP to obtain the characteristics of the object of control． The PID constants are calculated from the results and the Propor－ tional Band，Integral Time，and Derivative Time parameters are automatically set．
－Normally this parameter is aFF．AT is executed by pressing the 因 Key to select the PID set number．AT cannot be executed while control is stopped．
－Select 0 to specify the PID set currently being used for control． Select a number from 1 to 8 to specify a PID set number．
－The AT Execute／Cancel parameter automatically returns to arF when finished．
－The SP flashes if the Present Value（PV）／Preset Set Point parameter is monitored during AT．
－The channel cannot be changed during AT．
－Related Information

Reference
4．12 Starting and Stopping Operation（P．4－41）

- The MV change rate limits set the maximum allowed change in the MV (or the opening on a Position-proportional Control Model) per second. If a change occurs in the MV that exceeds this limit, the MV will be changed at the set rate limit until the required change is attained. When set to 0.0 , the function is disabled.
- For standard control, use the MV Change Rate Limit (Heating) parameter. The MV Change Rate Limit (Cooling) parameter cannot be used.
- For heating/cooling control, the MV change rate limit can be set separately for heating and cooling. Use the MV Change Rate Limit (Heating) parameter for heating and the MV Change Rate Limit (Cooling) parameter for cooling.
- The MV change rate limits cannot be used in the following situations:
- In Manual Mode
- When AT is being executed
- During ON/OFF control $(\mathrm{P}=0.00)$
- During a reset (i.e., while outputting the value set for the MV at Reset parameter)
- During an error (i.e., while outputting the value set for the MV at PV Error parameter)

### 8.8 PID Setting Level (2, (1)

This level contains the parameters for the PID constants, MV limits, and alarm settings for each PID set. To move to a PID set, use the Display PID Set Number parameter at the beginning of PID Setting Level.

## - Level Changes at Startup Up To PID Setting Level

- Parameter Changes within PID Setting Level

These parameters are used to store PID constants in each PID set. If AT is executed, the values are set automatically.

P action: Control action using an MV proportional to the deviation.
I action: Control action using an output that is proportional to the time integral of the deviation. The $P$ action causes an offset, and thus it is used in combination with the I action. As time elapses, the offset disappears and the controlled temperature and SP equalize.
D action: Control action using an output that is proportional to the time derivative of the input. The P action and I action serve to correct the control result and thus respond slowly to sudden temperature changes. The D action corrects control by adding an MV that is proportional to the slope of the temperature change.

| Parameter | Setting range | Unit | Default value |
| :--- | :--- | :--- | :--- |
| Proportional Band (P) | 0.00 to 999.99 | $\%$ FS | 10.00 |
| Integral Time (I) | 0.0 to 3999.9 | s | 233.0 |
| Derivative Time (D) | 0.0 to 3999.9 | s | 40.0 |

- For ON/OFF control, set the proportional band to 0.0 . The proportional band cannot be set to 0.0 on a Position-proportional Control Model.
- For P control or PD control, set the integral time to 0.0 . The integral time cannot be set to 0.0 on a Position-proportional Control Model when performing floating control or when the Operation at Potentiometer Input Error parameter is set to "Continue."
- Related Parameters AT Execute/Cancel (Adjustment Level) (P. 8-23)

| PID* MV Upper Limit | *. | 1.ad |
| :---: | :---: | :---: |
| PID* MV Lower Limit | *. al -1 |  |
| (*: 1 to 8) |  | ID control |

- Use the MV Upper Limit and MV Lower Limit parameters to set upper and lower limits for the MV. When the Controller calculates an MV that is outside of the upper and lower limits, the upper or lowerlimit is output.
- MV Upper Limit

The setting range differs for standard control and heating/cooling control. The cooling MV of heating/cooling control is expressed as a negative value.

- MV Lower Limit

The setting range differs for standard control and heating/cooling control. The cooling MV of heating/cooling control is expressed as a negative value.

- The MV limit function does not operate on a Position-proportional Control Model during floating control, and thus the setting is not effective.

| Parameter | Setting range | Unit | Default value |
| :---: | :---: | :---: | :---: |
| MV Upper Limit | Standard control: <br> MV lower limit + 0.1 to 105.0 | \% | 100.0 |
|  | Heating/cooling control: 0.0 to 105.0 | \% | 100.0 |
| MV Lower Limit | Standard control: <br> -5.0 to MV upper limit - 0.1 | \% | 0.0 |
|  | Heating/cooling control: $-105.0 \text { to } 0.0$ | \% | -100.0 |

The following MVs take priority over the MV limits:

- Manual MV
- MV at Reset
- MV at PV error
- Related Information

MV Limits in 5.3 Output Adjustment Functions (P. 5-15)

When using automatic selection of PID sets, use these parameters to set an upper limit for each PID set.

- Set the automatic selection range upper limit for PID Sets 1 to 8 .
- The limit for PID Set 8 is fixed at $110 \%$ of the sensor setting range, and thus does not need to be set.
- These upper limits are applied to the PV (present value), DV (deviation), or SP (present SP) set in the PID Set Automatic Selection Data parameter. The default setting is "PV."

Set the input type switch of each input to match the Input Type parameter of the corresponding input. The default setting is 2 (TC.PT).

## - Related Parameters

Input * Temperature Units (Input Initial Setting Level) (P. 8-51) SP Upper Limit and SP Lower Limit (Control Initial Setting Level) (P. 8-57)

- Select Celsius $\left({ }^{\circ} \mathrm{C}\right)$ or Fahrenheit $\left({ }^{\circ} \mathrm{F}\right)$ for the temperature unit.

| Scaling Input Value 1 | InP. 1 | 1.1 |
| :---: | :---: | :---: |
| Scaling Display Value 1 | d5P. |  |
| Scaling Input Value 2 | InP ${ }^{\text {a }}$ |  |
| Scaling Display Value 2 | dTP $\mathrm{I}^{2}$ |  |
| Decimal Point Position | $d$ | Analog input |

- These parameters are used with an analog input.
- Scaling is carried out for the analog input. The display value for the input value specified in the Scaling Input Value 1 parameter is set in the Scaling Display Value 1 parameter, and the display value for input value set in the Scaling Input Value 2 parameter is set in the Scaling Display Value 2 parameter.
- The Decimal Point Position parameter is used to specify the decimal point position of the set values (SP, etc.) given in EU.
- Scaling settings for inputs 2 to 4 of a Controller with more than one inputs are set for channels 2 to 4. Press the CH Key to change to

| Parameter | Setting range | Unit | Default value |
| :--- | :--- | :--- | :--- |
| Scaling Input Value 1 | Input lower limit to <br> input upper limit | $*$ | 4 |
| Scaling Display Value 1 | -19999 to <br> Scaling upper limit - 1 | EU | 0 |
| Scaling Input Value 2 | Input lower limit to <br> input upper limit | $*$ | 20 |
| Scaling Display Value 2 | Scaling lower limit + 1 <br> to 99999 | EU | 100 |
| Decimal Point Position | 0 to 4 | - | 0 |

* The unit depend on the input type setting.

The operation of E5AR-T/ER-T control functions and alarms is based on the input values. If a value greater than $-n_{1} P$ (Scaling Input Value 2) is set for InP. I (Scaling Input Value 1), operation will work in the opposite direction of the display values. The user must confirm compatibility with devices. For details, refer to 4.4 Setting the Input Type (P. 4-10).
Related Parameters
Refernce
Input $*$ Type (Input Initial Setting Level) (P. 8-50)

| Remote SP Upper Limit | -504 | Control with remote SP |
| :--- | :--- | ---: |
| Remote SP Lower Limit | $-5,5$ |  |

- This parameter sets the upper and lower limits for the remote SP. The remote SP upper limit is set with respect to the upper input range limit of input 2, and the remote SP lower limit is set with respect to the lower input range limit of input 2. For example, if input 2 is set to 4 to 20 mA , the remote SP upper limit is set with respect to 20 mA and the remote SP lower limit is set with respect to 4 mA .
- If the Input Type, Temperature Units, or scaling parameters for input 1 are changed, the upper and lower limit settings are changed to the upper and lower limits of the sensor.
- The decimal point position depends on the selected sensor. For an analog input, the decimal point position depends on the Decimal Point Position parameter.

The SP limits are in effect, and therefore if the input remote SP is above or below the SP limits, the SP will be clamped to the upper or lower limit.

* During cascade control, only channel 2 is displayed.

| Parameter | Setting range | Unit | Default value |
| :--- | :--- | :--- | :--- | :--- |

### 8.12 Control Initial Setting Level ( 1 . í)

This level contains Initial setting parameters for control, such as the control method, as well as the output types, SP limits, control mode, direct/reverse operation, and closed/floating settings.

- Level Changes at Startup Up To Control Initial Setting Level

## - Parameter Changes within Initial Control Setting Level

| Output 1 Type | at-t | 1.1 |
| :---: | :---: | :---: |
| Output 3 Type | aヨ-t | Model with multi-output |

Use these parameters to select the output types for multi-outputs.

- Select a voltage output (for driving SSR) or linear current output.
- When voltage output (for driving SSR) is selected, the output is 12 VDC, 21 mA for the E5AR-TQQ $\square \square W W-\square \square \square$ and 12 VDC, 40 mA for all other models.
- When linear current output is selected, use the Linear Current Output Type parameter to select an output of 0 to 20 mA or 4 to 20 mA .

| $\square$ | Setting range | Unit | Default value |
| :--- | :--- | :--- | :--- |
| 0: Voltage output (for driving SSR) <br> 1: Linear current output | - | 0 |  |

- Related Parameters

Linear Current Output * Type (Control Initial Setting Level) (P. 8-56)
Control/Transfer Output * Assignment (Control Initial Setting 2 Level) (P. 8-64)

Use these parameters to select the linear current output types.

- Select a 0 to 20 mA output or a 4 to 20 mA output.

| Setting range | Unit | Default value |
| :--- | :--- | :--- |
| $0: 0$ to 20 mA | - | 1 |
| $1: 4$ to 20 mA | - |  |

- Related Parameters

Control/Transfer Output * Assignment (Control Initial Setting 2 Level) (P. 8-64)

| CH |  |  |
| :--- | :--- | :--- |
| SP Upper Limit | $51-4$ | $\mathbf{L . 1}$ |
| SP Lower Limit | $51-1$ |  |

- Use these parameters to set upper and lower limits for the SP setting. The SP can be set only between these limits. If the limits are changed and a previously set SP falls outside of the limits due to the change, the SP will automatically change to the upper or lower limit.
- If the input type and temperature unit are changed, the SP upper and lower limits will change to the upper and lower limits of the sensor.
- The decimal point position depends on the selected sensor. For analog input, the decimal point position is determined by the Decimal Point Position parameter.

| Parameter | Setting range | Unit | Default value |
| :--- | :--- | :--- | :--- |
|  | Temperature: SP lower limit + 1 <br> to upper limit of input range | SP Upper | Analog: (SP lower limit + 1) to <br> (smaller of 99999 and display <br> Lalue equivalent to input upper <br> limit) | EU | 1300.0 |

Alarm Types 1 to 4
$=$ With standby sequence

- Use this parameter to select the condition for restarting the standby sequence after it has been canceled.
- Conditions A:
- At the start of operation (including after turning ON power),
- When the alarm value (alarm upper or lower limit) is changed,
- When the input correction (Input Value 1 for Input Correction, Input Correction 1, Input Value 2 for Input Correction, or Input Correction 2 parameter) is changed,
- When the SP of the current segment is changed (including changing the fixed SP in Fixed SP Mode),
- When program is started (including when the program is started for program repeats or links), or
- When the segment is changed (including when an advance is executed).
- Condition B: Power ON
- The following example shows operation using a lower-limit alarm with standby sequence.

- After changing the standby sequence reset setting, a software reset must be executed or the power turned OFF and ON to make the change take effect.

| Setting range | Unit | Default value |  |
| :---: | :---: | :---: | :---: |
| Setting | B: Condition $A$ <br> $b:$ Condition $B$ | - | A: Condition A |

### 8.15 Display Adjustment Level (2. $\mathbf{1}$-4)

This level contains parameters for adjustment of the display contents, including selection of the bar graph display items, display refresh period, Monitor Item Level settings, and display scan parameters.

- Level Changes at Startup Up To Display Adjustment Level

## - Parameter Changes within Display Adjustment Level

- This parameter is used to select which MV is displayed when a PF Key is set to "Present value (PV)," "Present set point," or "MV" during heating/cooling control.
- "Heating MV" or "Cooling MV" can be selected.

| Setting range | Unit | Default value |
| :---: | :---: | :---: |
| $\begin{array}{ll} \text { ar: } & \text { Heating MV } \\ \text { - } & \text { Cooling MV } \end{array}$ | - | a: Heating MV |

- Use this parameter to select the contents of the bar graph display of the E5AR-T.
- The bar graph of the E5AR-T is 10 segments.

| Setting range | Unit | Default value |
| :---: | :---: | :---: |
| aFF: No bar graph display <br> IEI: Deviation 1 EU/segment <br> IEEL: Deviation $10 \mathrm{EU} /$ segment <br> 20EL: Deviation 20 EU/segment <br> 100E:S: Deviation 100 EU/segment <br> a: Standard Control Model: Heating MV <br> Position-proportional Control Model: <br> Valve opening <br> [-a: Standard Control Model: Cooling MV | - | a:Standard Control Models: Heating MV, Position-proportional Control Model: Valve opening |

| Display Refresh Period $\quad$ d.rEF | $\square .4$ |
| :--- | :--- |

- This parameter is used to lengthen the refresh period of the monitor
value display. This only slows the display refresh cycle; it does not
affect the update period of the PV during control.
- To disable the function, select OFF.

Monitor Item Level Setting nan! 1.4

- One of the following levels can be selected as the Monitor Item Level setting: Input Initial Setting Level, Control Initial Setting Level, Control Initial Setting 2 Level, Alarm Setting Level, Display Adjustment Level, Communications Setting Level, Advanced Function Setting Level, and Expansion Control Setting Level.
- The Monitor Item Level is added after the Approximation Setting Level.
- When OFF is selected, the function is disabled (i.e., the Monitor Item Level is disabled).

|  | Setting range | Unit | Default value |
| :---: | :---: | :---: | :---: |
|  | arF: Monitor Item Level disabled. |  |  |
|  | 1.5: Input Initial Setting Level |  |  |
|  | t. $:$ Control Initial Setting Level |  |  |
|  | L.2: Control Initial Setting 2 Level |  |  |
|  | 13: Alarm Setting Level | - | arm |
|  | 1.4: Display Adjustment Level |  |  |
|  | 1.5: Communications Setting Level |  |  |
|  | AdF: Advanced Function Setting Level |  |  |

| Start Display Scan after Power ON | 5 | 1.4 |
| :---: | :---: | :---: |
| Display Scan Period | $55-5$ | Controller with more than one input |

- The display scan automatically switches through channels on the display when multiple channels are used on a Controller with more than one input.
- The display scan shows only channels that are enabled using the Number of Enabled Channels parameter.
- The display scan can be started automatically after the power is turned ON or by pressing the CH Key.
- To have display scan start automatically after the power is turned ON, set the Start Display Scan after Power ON parameter to ON.
- The display scan period is set in the Display Scan Period parameter. If the period is set to 0 , the display scan is disabled.

| Parameter | Setting period | Unit | Default value |
| :--- | :--- | :--- | :--- |
| Start Display Scan <br> after Power ON | arF: Disable <br> an: Enable | - | arF: Disable |
| Display Scan Period | 0 to 99 <br> (0: Display scan disabled.) | s | 2 |

### 8.16 Communications Setting Level (3. $\mathbf{( 1 )}$

This level contains Initial setting parameters for communications, such as parameters for the protocol selection, communications unit number, and communications speed.

- Level Changes at Startup Up To Communications Setting Level

Parameter Changes within Communications Setting Level

- This parameter is used to select the communications protocol. Selections are CompoWay/F, OMRON's unified protocol for generalpurpose serial communications, or Modbus, Modicon Inc.'s protocol based on RTU Mode of Modbus Protocol (Specifications: PI-MBUS300 Rev.J).

|  | Setting range | Unit | Default value |

4.12 Starting and Stopping Operation (P. 4-41)

ESEL
EET

This parameter is used to specify the operation status after the program has been completed.

- Reset: Operation ends
- Continue: Operation is continued using the SP of the last segment.
The number of the last segment is held as the segment number, and the elapsed program time, elapsed segment time, and remaining segment time values are held. The time singles will hold status when operation ends.
- Fixed SP Mode: Operation continues in Fixed SP Mode when the program has been completed.
The segment number, elapsed program time, elapsed segment time, and remaining segment time are held at the values for the beginning of the segment.
The Time Signal parameter is set to OFF.

|  | Setting range | Unit | Default value |

LEK

This parameter is used to specify the Wait operating mode.

- Wait at Segment End

When this set value is selected, the program will not move to the next segment when one segment is completed unless the difference (deviation) between the PV and SP are within the wait band. The program will move to the next segment as soon as the deviation is within the wait band.

- Always Wait

The difference (deviation) between the PV and SP are constantly compared during program operation. If the deviation is not within the wait band the SP is held at the point that the deviation went outside the wait band and the program does not move on. The program moves on as soon as the deviation enters the wait band.

| Temporary AT Execution Judgement | EREE* | During cascade heating/cooling control, only |
| Deviation | channel 1 is displayed. |  |

- These parameters are normally used at the default values.
- The AT Calculated Gain parameter specifies the gain used when PID constants are calculated during AT. A smaller gain provides greater adaptability, while a larger gain provides greater stability.
- The AT Hysteresis parameter is used to set the hysteresis when switching ON/OFF during the limit cycle while AT is being executed.
- The Limit Cycle MV Amplitude parameter is used to set the MV amplitude during the limit cycle while AT is being executed. This is effective when $P \neq 0.00$ in standard control, or when closed is selected in proportional control.
- The Temporary AT Execution Judgement Deviation parameter is used to determine whether temporary AT is executed when executing AT. If AT is executed when the deviation is greater than the set value, temporary AT is executed. This is effective when $P \neq 0.00$ in standard control, or when closed is selected in proportional control.

## Section 9 User Calibration

9.1 Parameters for User Calibration ..... 9-2
9.2 User Calibration ..... 9-4
9.3 Thermocouple Input Calibration ..... 9-5
9.4 Analog Input Calibration ..... 9-8
9.5 Resistance Thermometer Calibration ..... 9-10
9.6 Output Calibration ..... 9-12
9.7 Inspecting Indicator Accuracy ..... 9-14

### 9.1 Parameters for User Calibration

- To perform user calibration, enter 1201 for the Move to Calibration Level parameter in the Advanced Function Setting Level. The Controller will enter Calibration Mode and Rain will be displayed on the display.
- If the Move to Calibration Level parameter does not appear, set the Initial Setting Protection parameter to 0 in the Protect Level and then move to Advanced Function Setting Level.
- Calibration is ended by turning OFF the power.
- The parameters for input calibration are shown below.
(The last digit of Display No. 1 shows the input number. The example below shows 1 for input 1 . For input 2, the display would show 9 I90.2.)

## Output Calibration Parameters

The parameters for output calibration are shown below. The display depends on the output type setting for each output.
(In the following example, the last digit of Display No. 1 shows 1 for output 1. For output 2, this would be ancic. .)

If user calibration was performed on any of inputs 1 to 4 or outputs 1 to 6 following purchase of the Controller, user calibration information will be displayed as shown below when you move to Calibration Level.

### 9.2 User Calibration

The E5AR-T/ER-T is calibrated before shipment from the factory and thus there is normally no need for the user to perform calibration.

If user calibration is necessary, use the calibration functions for temperature inputs, analog inputs, and outputs that are provided in the Controller. Be aware, however, that OMRON cannot ensure the results of calibration by the user.

The calibration data is overwritten each time calibration is performed. You cannot return to the fac-tory-calibrated data after performing user calibration.

## Input Calibration

Calibration is performed for the input type set in the Input Type parameter. Input types consist of the following 20 types:

- Thermocouples: 13 types
- Analog input: 5 types
- Resistance thermometers: 2 types

Calibration is performed for the output type set in the Output Type parameter. There is only one output type that can be selected:

- Linear current output

## Registering Calibration Data

The new calibration data for each item is temporarily registered. It can be permanently registered as calibration data only when all items have been calibrated to new values. Be sure to temporarily register all items when you calibrate the E5AR-T/ER-T.

When calibration data is registered, user execution of calibration is also registered.

Prepare separate measuring devices and equipment for calibration. For details on how to handle measuring devices and equipment, refer to the respective instruction manuals.

### 9.3 Thermocouple Input Calibration

- Thermocouples are calibrated in two groups according to thermocouple type: Group 1 (input types 2, 4, $7,8,10,14$ ) and Group 2 (input types 3, 5, 6, 9, 11, 12, 13).
- Do not obstruct the bottom of the Controller during calibration. Also, do not touch the input terminals or compensating leads.

## - Preparations

- Use a cold junction compensator for calibration of internal thermocouples and set it to $0^{\circ} \mathrm{C}$. The internal thermocouple should be disabled (end open).
- "STV" in the diagram is a DC reference current/voltage generator.
- Prepare compensating leads appropriate for the selected thermocouple. A cold junction compensator and compensating leads for a $K$ thermocouple can be used for thermocouples R, S, E, B and W.

Connecting the cold junction compensator

A correct input value cannot be obtained if the compensation wire connector is touched during thermocouple calibration. Therefore, to connect or disconnect the cold junction compensator, short-circuit (enable) or open-circuit (disable) the tip of the thermocouple inside the cold junction compensator, while keeping the compensation wire connected as shown in the diagram.

Compensating wire

Compensating wire

Input types 2, 4, 7, 8, 10, 14

Input types 3, 5, 6, 9, 11, 12, 13

|  |  |
| :---: | :---: |
|  |  |
|  | 58 |
| Camm | \% |
| $\square$ |  |

Input types 2, 4, 7, 8, 10, 14

Follow these steps to perform calibration when thermocouple input is selected.

1. Connect the power supply.
2. Connect the DC reference current/voltage generator (STV below), precision digital meter (DMM below), and cold junction compensator (a ZERO-CON is used as an example below) to the input terminals of the thermocouple as shown below.

3. Turn ON the power.
4. Move to Calibration Level.

A 30-minute aging timer will begin. Perform aging using this timer as a guideline. When 30 minutes has elapsed, Display No. 2 will show 0.

You can proceed to the next stop before the display shows 0 .
5. Press the Key. The display at the left will appear.

The count value that was input will be displayed on Display No. 2 in hexadecimal. Set the STV as follows:

- For input types $2,4,7,8,10$, and 14: 53 mV
- For input types $3,5,6,11,12$, and 13: 22 mV

Wait until the count on Display No. 2 is sufficiently stable and then press the Key. This tentatively registers the calibration data at this point.
6. Press the Key. The display at the left will appear.

Set the STV to -6 mV .
Wait until the count on Display No. 2 is sufficiently stable and then press the $\mathbb{N}$ Key. This tentatively registers the calibration data at this point.
7. Press the Key. The display at the left will appear.
8. Change the wiring as shown below.

Disconnect the STV and enable the thermocouple in the cold junction compensator. Make sure that the STV is disconnected at this time.
9. Wait until the count on Display No. 2 is sufficiently stable and then press the $\triangle$ Key. This tentatively registers the calibration data at this point.
10. Press the Key. The display at the left will appear. This display will not appear if all of the required data has not been tentatively registered.
Press the 园 Key. Display No. 2 will show tys. Two seconds after the Key is released or when the Key is pressed, the tentatively registered calibration data will be stored in EEPROM. If you do not wish to save the data in EEPROM, press the Key instead of the 图 Key.

- For a Controller with more than one input, connect as explained in step 2 and repeat steps 5 to 10.
- If a linear current output is selected, continue with the procedure in 9.6 Output Calibration (P. 9-12).

11. Turn OFF the power to leave Calibration Mode.

### 9.4 Analog Input Calibration

Input types 15 and 16

Input types 17 and 18

Input type 19

Analog inputs are calibrated in the following groups according to the analog input type: current input group ( 15,16 ), voltage input group 1 (17, 18), and voltage input group 2 (19).

E5AR-T/ER-T

1. Connect the power supply.
2. Connect the STV and DMM to the input terminals of the analog input as shown above.
Different input terminals are used for current input and voltage input. Make sure the connections are correct.
3. Turn ON the power.
4. Move to Calibration Level.

A 30-minute aging timer will begin. Perform aging using this timer as a guideline. When 30 minutes has elapsed, Display No. 2 will show 0.
You can proceed to the next stop before the display shows 0.
5. Press the Key. The display at left will appear.

The count value that was input will be displayed on Display No. 2 in hexadecimal. Set the STV as follows:

- For input types 15 and 16: 20 mA
- For input types 17 and 18: 5 V
- For input type 19: 10 V

6. Wait until the count on Display No. 2 is sufficiently stable and then press the $\approx$ Key. This tentatively registers the calibration data at this point.

Input types 15 and 16

Input types 17 and 18

Input type 19

7. Press the Key $\square$. The display at the left will appear.

Set the STV as follows:

- Input types 15 and 16: 1 mA
- Input types 17 and 18: 1 V
- Input type 19: 1 V

8. Wait until the count on Display No. 2 is sufficiently stable and then press the $\approx$ Key. This tentatively registers the calibration data at this point.
9. Press the Key. The display at the left will appear. This display will not appear if all of the required data has not been tentatively registered.
Press the 图 Key. Display No. 2 will show $\operatorname{GES}$. Two seconds after the Key is released or when the Key is pressed, the tentatively registered calibration data will be stored in EEPROM. If you do not wish to save the data in EEPROM, press the Key instead of the Key.

- For a Controller with more than one input, connect as explained in step 2 and repeat steps 5 to 9 .
- If linear current output is selected, continue with the procedure in 9.6 Output Calibration (P. 9-12).

10. Turn OFF the power to leave Calibration Mode.

### 9.5 Resistance Thermometer Calibration

The procedure for calibrating a resistance thermometer is provided in this section.

Use wiring of the same thickness for the connections.

1. Connect the power supply.
2. Connect a precision resistance box (a 6-dial model in this procedure) to the input terminal of the resistance thermometer as shown at left.
3. Turn ON the power.
4. Move to Calibration Level.

A 30-minute aging timer will begin. Perform aging using this timer as a guideline. When 30 minutes has elapsed, Display No. 2 will show 0. You can proceed to the next stop before the display shows 0 .
5. Press the Key to display the count value for each input type.

At this time, the count value that was input will be displayed on Display No. 2 in hexadecimal. Set the 6 -dial resistance box as follows:

- Input type 0: $390 \Omega$
- Input type 1: $160 \Omega$

6. Wait until the count on Display No. 2 is sufficiently stable and then press the $\approx$ Key. This tentatively registers the calibration data at this point.

Input type 0

Input type 1

7. Press the Key. The display at the left will appear.

Set the 6-dial resistance box as follows:

- Input type 0: $20 \Omega$
- Input type 1: $40 \Omega$

8. Wait until the count on Display No. 2 is sufficiently stable and then press the $\boxtimes$ Key. This tentatively registers the calibration data at this point.
9. Press the Key. The display at the left will appear. This display will not appear if all of the required data has not been tentatively registered.
Press the 图 Key. Display No. 2 will show tys. Two seconds after the Key is released or when the is pressed, the tentatively registered calibration data will be stored in EEPROM. If you do not wish to save the data in EEPROM, press the Key instead of the Key.

- For a Controller with more than one input, connect as explained in step 2 and repeat steps 5 to 9 .
- If linear current output is selected, continue with the procedure in 9.6 Output Calibration (P. 9-12).

10. Turn OFF the power to leave Calibration Mode.

## 9．6 Output Calibration

－The procedure for calibration when linear current output is selected is provided in this section．
－Output calibration is displayed after input calibration has been finished（i．e．，after the input calibration values are registered）．（Perform aging for at least 30 minutes．）

（Output upper－limit）

（Output lower－limit）

（Output lower－limit）

1．The registered input calibration value state is displayed as shown at left．
2．Connect a precision digital meter（DMM below）to the output terminal of the linear current output as shown below．

3．Press the Key．The display at left will appear and 20 mA calibration will begin．

4．While viewing the output on the DMM，use the and $\approx$ Keys to set the output to 20 mA ．In the example at left， 20 mA is displayed at a value 2 digits smaller than before calibration．

5．Press the Key．The display at left will appear and 4 mA calibration will begin．

6．While viewing the output on the DMM，use the and $\sqrt{ }$ Keys to set the output to 4 mA ．In the example at left， 4 mA is displayed at a value 2 digits smaller than before calibration．

7．Press the Key．The display at the left will appear．This display will not appear if all of the required data has not been tentatively registered，or if the data has not been changed．
Press the 园 Key．Display No． 2 will show GE5．Two seconds after the Key is released or when the $\square$ is pressed，the tentatively registered calibration data will be stored in EEPROM．If you do not wish to save the data in EEPROM，press the 囤 Key instead of the 因 Key．

- If there is another output, connect the output as explained in step 2, and repeat steps 3 to 7 .

8. Turn OFF the power to quit Calibration Mode.

### 9.7 Inspecting Indicator Accuracy

- After calibrating an input, always inspect the indicator accuracy to verify that the input was calibrated correctly.
- Operate the E5AR-T/ER-T in the PV/SP state.
- Check the indicator at three points: the upper limit, lower limit, and mid-range limit of the indicator range.

## ■ Thermocouples

- Preparations

Connect the required devices as shown below. Be sure to connect the E5AR-T/ER-T to the cold junction compensator using the compensating leads that you intend to use for the thermocouple.

Make sure that the cold junction compensator is at $0^{\circ} \mathrm{C}$, and set the STV output to the voltage that is equivalent to the inspection value startup power.
If the cold junction compensating system uses an external setting, a cold junction compensator and compensating leads are not needed.

## Resistance Thermometers

- Preparations
- Operation

Connect the required devices as shown below.

Set the 6-dial resistance box to the resistance that is equivalent to the inspection value.

## Analog Inputs

- Preparations

Connect the required devices as shown below.

- Operation

Set the STV output to the inspection value voltage or current.

## Section 10 Troubleshooting

10.1 Troubleshooting Checklist ..... 10-2
10.2 Error Messages ..... 10-3
10.3 Inferring Causes from Conditions:
Abnormal Measured Values ..... 10-5
10.4 Inferring Causes from Conditions: Abnormal Control ..... 10-7
10.5 Inferring Causes from Conditions: Abnormal Outputs ..... 10-10
10.6 Inferring Causes from Conditions:Communications Problems10-11
10.7 Inferring Causes from Conditions: Reset Operation. ..... 10-12

### 10.1 Troubleshooting Checklist

If you encounter difficulty with the Controller, use the following checklist to troubleshoot the problem.

Check the operating state of the E5AR-T/ER-T as indicated by the display.

Error messages and indicators are described in 10.2 Error Messages (P. 10-3). If an error message is displayed, refer to this section to troubleshoot the problem.

Check switch settings and wiring

- Power Supply
- Is the power turned ON?
- Is the terminal voltage within the specified range?
- Input Type Switch
- Is the switch set to the correct setting for the sensor you are using?
- Wiring
- Are the terminal connections correct?
- Are the polarities correct?
- Are any wires loose?
- Are any wires or cables broken or not making contact?
- Communications Settings
- Do the communications settings match those of the host system?

If you are unable to identify the problem from the above or cannot solve the problem, investigate in more detail.

- Are the parameters set correctly?
- Check for restrictions on the function you are using. See if the cause of the problem lies in your settings.

If you were not able to identify the cause of the problem by checking the above, refer to the tables starting in 10.2 Error Messages (P. 10-3).

## 10．2 Error Messages

When an error occurs，Displays No． 1 and 2 show error messages．Refer to the following table to check the meaning of the message and troubleshoot the problem．

| Display No． 1 | Display No． 2 | Error | Correction | Output state at error |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Control outputs | Alarm output |
| Uimit | Err | Unit error | The unit requires servicing． Contact your OMRON representative． | OFF | OFF |
| Uinct | ［H5 | Unit change |  | OFF | OFF |
| disp | Err | Display unit error |  | OFF | OFF |
| 545 | Err | Unit error |  |  |  |
| EEP | Err | EEPROM error | First，turn the power OFF then back ON again．If the display remains the same，hold down the $\square$ Key for at least 5 seconds in the error display to initialize．（See Caution．） | OFF | OFF |
| S．Err | Normal display | Input error | Check for an incorrect input connection，broken wire，or short－ circuit．Check the Input Type parameter and input type switch settings． | MV output according to MV at PV Error parameter． | Operation will be performed in the same way as when the upper limit is exceeded． |
| ceces | Normal display | Exceeded bottom of display range | Not an error．One of these messages is displayed when the PV exceeds the display range （－19999 to 99999）． | Normal operation | Normal operation |
| ココココ |  | Exceeded top of display range |  |  |  |
| Normal display | RSP <br> operation indicator flashes | RSP input error | Is the wire connected to the RSP input broken or short－circuited？ For coordinated operation，check the input type for the RSP input from channel 1 to be sure it＇s correct and check to see if the display range has been exceeded for the channel due to a SP offset setting． | MV at PV error | OFF |
| Normal display | －－－－－ | Potentiometer input error | Check the potentiometer wiring． | If the Closed／Floating parameter is set to＂Closed＂ and the Operation at Poten－ tiometer Input Error param－ eter is set to＂OFF，＂the value set for the MV at PV Error parameter is output； otherwise，normal operation takes place． | Normal operation |
| CPG | Err | Motor calibration error | Check the wiring to the potentiometer and valve drive motor，and then try motor calibration again． | OFF | OFF |
| $\begin{aligned} & =1-6 \\ & -2-6 \\ & -3-1 \\ & -4-6 \end{aligned}$ | Set value flashes | Input type switch error | Set the input type switch to type of input you are using so that it agrees with the setting of the Input Type parameter． | OFF | OFF |

If the system does not operate as expected after setting the parameters，check the wiring and set values once again．If there is still a problem，unintended set values may have been accidentally set in the param－ eters．In this case，you may want to initialize the Controller and redo your settings．

Initializing the Controller will return all parameters to their default settings. The default settings may cause unexpected outputs, so disconnect all output wires and eliminate the effects to the system before initializing the parameters. In addition, write down your settings prior to initialization.

### 10.3 Inferring Causes from Conditions: Abnormal Measured Values

## ■ The Measured Value Is Abnormal or Measurement Is Not Possible

|  | Possible cause | Solution |
| :---: | :---: | :---: |
|  | The polarity or connections to the temperature sensor are not correct. | Connect the wires correctly. |
|  | A temperature sensor that cannot be used with the E5AR-T/ER-T is connected. | Change to a temperature sensor that can be used with the E5AR-T/ER-T. |
|  | The temperature sensor has a broken wire, a shortcircuit, or has deteriorated. | Replace the temperature sensor. |
|  | A temperature sensor is not connected. | Connect a temperature sensor. |
|  | Compensating leads that are incompatible with the thermocouple are being used. | - Directly connect a thermocouple with long leads. <br> - Use compatible compensating leads. |
|  | A metal device other than the thermocouple or compensating leads is connected between the terminals of the E5AR-T/ER-T and thermocouple. | Connect with a device that is designed for use with thermocouples. |
|  | The terminal connection screws are loose, resulting in a bad connection. | Tighten the screws securely. |
|  | The leads or compensating leads of the thermocouple is too long and resistance is affecting the system. | - Use thick compensating leads. <br> - Change the wiring and locations to allow shorter lengths. |
|  | The 3 wires between the terminals of the E5AR-T/ ER-T and the platinum resistance thermometer have different resistances. | Use wires of the same resistance for terminals A, $B$, and $B$. |
|  | The E5AR-T/ER-T is receiving noise from peripheral devices. | - Separate the E5AR-T/ER-T from noise-emitting devices. <br> - Install a surge absorber or noise filter in noiseemitting devices. |
|  | The leads and power line of the temperature sensor are too close, and induction noise is being received from the power line. | - Separate the leads from the power line. <br> - Run the leads and power line through separate conduits or ducts. <br> - Do not wire the leads in parallel with the power line. <br> - Change the wiring to allow shorter leads. <br> - Use shielded cable for the leads. |
|  | The mounting location of the temperature sensor is too far from the point of control and the thermal response is slow. | Mount the sensor so that the end of the protective tubing approaches the point of control. |
|  | The ambient operating temperature of the E5AR-T/ ER-T exceeds the rated temperature. | Keep the ambient operating temperature within the specified range: -10 to $55^{\circ} \mathrm{C}$. |
|  | Wireless devices are used near the E5AR-T/ER-T. | Shield the E5AR-T/ER-T. |
|  | The temperature of the terminal plate is not uniform due to heat dissipation from peripheral devices. | Install the E5AR-T/ER-T in a location where it is not exposed to heat dissipation. |
|  | The terminal plate of the E5AR-T/ER-T is exposed to a strong air flow. | Prevent air flows from blowing on the terminal plate. |
| $\infty$ <br> © <br> © | The input type switch setting is not correct. | Set the input type switch to the correct setting for the input. |
|  | The Input Type parameter is not set correctly. | Set the correct input type. |
|  | The temperature unit setting is not correct. | Set the correct temperature unit. |
|  | The measured temperature appears to deviate after setting an input correction. | Set the input correction to 0.0. |
|  | The units of the parameter settings are not correct. | Correct the host system program. |
|  | The host system program is not correct. |  |

|  | Possible cause | Solution |
| :---: | :---: | :---: |
| $\stackrel{\otimes}{\square}$ | The input terminals for thermocouple input are short-circuited. | Connect the thermocouple. |
| O O ¢ ¢ ¢ | A temperature sensor was replaced or a switch setting was changed while the power was ON. | Turn the power OFF and then ON. |

## Supplement

## Simple Method for Checking Input

Platinum Resistance Thermometer:

1) Connect a $100 \Omega$ resistor between input terminals $A-B$ and short-circuit $B-B$.
2) If the measured temperature is approximately $0.0^{\circ} \mathrm{C}$ or $32.0^{\circ} \mathrm{F}$, the E5AR-T/ER-T is operating normally.
Thermocouple:
3) Short-circuit the input terminals of the temperature sensor.
4) If the temperature close to the terminal plate is measured, the E5AR-T/ER-T is operating normally. Analog Input:

Use a reference voltage/current generator (e.g., an STV) to supply the specified current or voltage and check the measurement.

### 10.4 Inferring Causes from Conditions: Abnormal Control

## - The PV Does Not Increase

|  | Possible cause | Solution |
| :---: | :---: | :---: |
|  | Abnormal measured value. | Troubleshoot as described in 10.3 Inferring Causes from Conditions: Abnormal Measured Values (P. 10-5). |
|  | A load is not connected to the control output terminals. | Connect a load. |
|  | Incorrect load polarity or incorrect terminal connections. | Wire correctly. |
|  | The terminal connection screws are loose, resulting in a bad connection. | Tighten the screws securely. |
|  | The heater power is not turned ON. | Turn ON the heater power. |
|  | The heater has a broken wire or has deteriorated. | Replace the heater. |
|  | The heater has a low heat capacity. | - Change to a heater with a high heat capacity. <br> - If using two or more heaters, replace any heaters that have broken wires. |
|  | The overheating prevention device has activated. | Increase the temperature setting of the overheating prevention device to a value higher than the SP of the E5AR-T/ER-T. |
| $\begin{aligned} & \text { © } \\ & \text {. } \\ & \text { = } \\ & \text { © } \end{aligned}$ | Direct operation and reverse operation settings are incorrect. | Set the correct settings. |
|  | The PID constants are not suitable. | - Execute AT. <br> - Set suitable PID constants. |
|  | Control has not been started. | Start control. |
|  | The output does not increased due to MV limits. | Change the MV limits to suitable values. |
|  | The cooling fan is running. | Stop the cooling fan. |

## The Measured Value Increases Above the SP

|  | Possible cause | Solution |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { N } \\ & \text { 을 } \\ & \text { D } \\ & 0 \\ & 0 \\ & 0 \end{aligned}$ | Abnormal measured value. | Troubleshoot as described in 10.3 Inferring Causes from Conditions: Abnormal Measured Values (P. 10-5). |
|  | The load is connected to the wrong channel and the heater is being controlled by the control output of another channel. | Wire correctly. |
|  | The contact of the control output drive relay has melted. | Replace the relay. |
|  | Short-circuit failure in SSR. | Replace the SSR. |
|  | Current flows to heater due to SSR leakage current. | Connect a bleeder resistor to prevent operation due to leakage current. |

|  | Possible cause | Solution |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { © } \\ & \stackrel{\text { ¢ }}{\substack{0}} \end{aligned}$ | Direct operation and reverse operation settings are incorrect. | Set the correct settings. |
|  | The PID constants are not suitable. | - Execute AT. <br> - Set suitable PID constants. |
|  | The output does not decrease due to MV limits. | Change the MV limits to suitable values. |
|  | Output is taking place in Manual Mode. | Leave Manual Mode. |
|  | The controlled object generates heat. | Use heating/cooling control. |
|  | Large overshoot. | See the Overshooting or Undershooting Occurs troubleshooting table. |

## ■ Overshooting or Undershooting Occurs

|  | Possible cause | Solution |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { n } \\ & .0 \\ & \text { 으 } \\ & 0 \\ & 0 \\ & 0 \\ & 0 \end{aligned}$ | Abnormal measured value. | Troubleshoot as described in 10.3 Inferring Causes from Conditions: Abnormal Measured Values (P. 10-5). |
|  | A regular slow thermal response temperature sensor is connected to a fast thermal response control system. | Change to a sheathed temperature sensor. |
|  | The proportional band is too narrow, i.e., the P constant is too small. | - Increase the P constant to within the point where the response speed becomes too slow. <br> - Execute AT. |
|  | The integral time is too short, i.e., the I constant is too small. | - Increase the I constant to within the point where the response speed becomes too slow. <br> - Execute AT. |
|  | The derivative time is too short, i.e., the D constant is too small. | - Increase the D constant to within the point where stability during rectification deteriorates. <br> - Execute AT. |
|  | ON/OFF control is being performed. | Use P control or PID control. |
|  | The control period is too long in a fast thermal response control system. | Shorten the control period. |
|  | The overlap band is mistakenly set as a dead band in heating/cooling control. | Set an overlap band. |

## ■ Hunting Occurs

Check connections and settings as explained above in Overshooting or Undershooting Occurs.

|  | Possible cause | Solution |
| :---: | :---: | :---: |
|  | The heat capacity of the heater is too large for the heat capacity of the controlled object. | Use a heater with a heat capacity suitable for the controlled object. |
|  | Periodic disturbances occur that cause the heat capacity of the controlled object to change. | Establish an environment will minimal disturbances. |
|  | AT is being executed. | Hunting will stop when AT has been completed. |

## SP Does Not Change as Programmed

|  | Possible cause | Solution |
| :---: | :---: | :---: |
| ¢ | Remote SP Mode or Fixed SP Mode is set. | Set Program SP Mode. |

## The Segment Does Not Advance

|  | Possible cause | Solution |
| :---: | :--- | :--- |
| の <br>  <br>   <br>   | The wait operation is enabled. | Set the Wait Mode, Wait Band Upper Limit, and <br> Wait Band Lower Limit correctly. |
|  | The SP is being held. | Check the HOLD indicator. If it is lit, change the <br> Hold parameter to "OFF." |

## The Program Is Reset in the Middle

|  | Possible cause | Solution |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { © } \\ & \stackrel{=}{ \pm} \\ & \substack{0 \\ \hline} \end{aligned}$ | The Number of Segments Used parameter is set to a smaller value than the final segment number. | Correct the setting of the Number of Segments Used parameter. |

### 10.5 Inferring Causes from Conditions: Abnormal Outputs

## ■ No Control Output or No Alarm Output

|  | Possible cause | Solution |
| :---: | :---: | :---: |
|  | Abnormal temperature measurement. | See 10.3 Inferring Causes from Conditions: Abnormal Measured Values (P. 10-5). |
|  | Incorrect load polarity or incorrect terminal connections. | Wire correctly. |
|  | The connected load exceeds the output specifications. | - Do not exceed the specifications. <br> - Repair in the event of a failure. |
|  | A load power supply is not connected to a transistor output. | Use a power supply suitable for the output specifications and load. |
|  | The polarity of the load power supply connected to the transistor output is incorrect. | Wire correctly. |
|  | Operation stops after the power is turned ON. | - Send the Run command after turning ON the power. <br> - Set operation to continue at startup. |
|  | Control has not been started. | Send the Run command. |
|  | The wrong channel is specified. | Set the correct channel number. |
|  | The wrong SP is set. | Set the correct SP. |
|  | The wrong program number is set. | Set the correct program number |
|  | When using event inputs to set the program number, the inputs are not held ON or OFF. | Keep the contacts ON or OFF to specify the program number. |
|  | An attempt was made to use communications to set the program number when using event inputs were being used to set the program number. | The latest specification takes priority regardless of the program number specification method. |
|  | The alarm mode is set to 0 (No Alarm). | Set the correct alarm mode. |
|  | An alarm with a standby sequence is specified. | Specify an alarm without a standby sequence. |
|  | A deviation alarm is mistakenly set for an absolutevalue alarm, or vice-versa. | Set the correct alarm mode. |

### 10.6 Inferring Causes from Conditions: Communications Problems

## Cannot Communicate or No Response

|  | Possible causes |  |
| :--- | :--- | :--- |
|  | The baud rate differs from the host system. | Make sure that the baud rates are the same. |

### 10.7 Inferring Causes from Conditions: Reset Operation

## 1 Outputs Are Made While Resetting (Operation Will Not Stop)

|  | Possible cause | Solution |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { © } \\ & \stackrel{C}{\vdots} \\ & \text { © } \end{aligned}$ | The MV at Reset parameter (Adjustment Level) is set to a value greater than 0\%. | Set the MV at Reset parameter to 0.0. |
|  | Manual Mode is in effect. | Set the manual output to $0 \%$ or switch to Auto Mode. |
|  | The Operation at Reset parameter (Control Initial Setting Mode) is set to "Fixed Control." | Set the Operation at Reset parameter to "Stop Control." |

## Specifications

■ Unit Ratings

| Power supply voltage for CE marking (See note 1.) |  | 100 to 240 VAC, $50 / 60 \mathrm{~Hz}$ | 24 VAC, 50/60 Hz or 24 VDC |
| :---: | :---: | :---: | :---: |
| Power supply voltage for UL certification (See note 1.) |  | 100 to 120 VAC, $50 / 60 \mathrm{~Hz}$ | 24 VAC, 50/60 Hz or 24 VDC |
| Allowable voltage fluctuation range |  | $85 \%$ to $110 \%$ of rated voltage |  |
| Power consumption |  | E5AR-T: 22 VA max. E5ER-T: 17 VA max. | E5AR-T: $15 \mathrm{VA} / 10 \mathrm{~W}$ max. E5ER-T: $11 \mathrm{VA} / 7 \mathrm{~W}$ max. |
| Sensor inputs (See note 2.) |  | Thermocouples: K, J, T, E, L, U, N, R, S, B, W <br> Platinum resistance thermometers: Pt100 <br> Current input: 4 to 20 mA DC or 0 to 20 mA DC (including remote SP input) Voltage input: 1 to 5 VDC, 0 to 5 VDC, or 0 to 10 VDC (including remote SP input) (Input impedance: $150 \Omega$ using current input, approx. $1 \mathrm{M} \Omega$ using voltage input) |  |
| Control outputs | Voltage outputs (for driving SSRs) | $12 \mathrm{VDC}, 40 \mathrm{~mA} \mathrm{max}$. (See note 3.), with short-circuit protection circuit |  |
|  | Current outputs | 0 to 20 mA DC or 4 to $20 \mathrm{~mA} \mathrm{DC}, \mathrm{load:} 500 \Omega$ max. (including transfer output) (Resolution: Approx. 54,000 at 0 to 20 mA DC , approx. 43,000 at 4 to 20 mA DC ) |  |
|  | Relay outputs | Position-proportional Control Model (open, close) <br> SPST-NO, 250 VAC, 1 A (including inrush current) (inductive load), electrical life: approx. 100,000 operations |  |
| Auxiliary outputs | Relay outputs | SPST-NO, 250 VAC, 1 A (resistive load), electrical life: approx. 100,000 operations |  |
|  | Transistor outputs | Maximum load voltage: 30 VDC, maximum load current: 50 mA Residual voltage: 1.5 V max., leakage current: 0.4 mA max. |  |
| Event inputs | Contact inputs | Input ON: $1 \mathrm{k} \Omega$ max., OFF: $100 \mathrm{k} \Omega$ max. |  |
|  | Non-contact inputs | Input ON: Residual voltage of 1.5 V max., input OFF: Leakage current of 0.1 mA max. |  |
|  |  | Short-circuit current: Approx. 4 mA |  |
| Remote SP input |  | See Sensor inputs. |  |
| Potentiometer input |  | $100 \Omega$ to $2.5 \mathrm{k} \Omega$ |  |
| Transfer output |  | See Control outputs. |  |
| Control method |  | 2-PID or ON/OFF |  |
| Setting method |  | Digital setting using front panel keys or setting via serial communications |  |
| Indication method |  | 7-segment digital display and LED indicators E5AR-T character height: PV: 12.8 mm , SV: 7.7 mm , PRG.SEG: 7.7 mm E5ER-T character height: PV: 9.5 mm , SV: 7.2 mm , PRG.SEG: 7.2 mm |  |
| Other functions |  | Varies by model. |  |
| Ambient operating temperature |  | -10 to $55^{\circ} \mathrm{C}$ (no condensation or icing), 3-year warranty: -10 to $50^{\circ} \mathrm{C}$ |  |
| Ambient operating humidity |  | 25\% to 85\% |  |
| Storage temperature |  | -25 to $65^{\circ} \mathrm{C}$ (no condensation or icing) |  |

Note 1. 100 to 240 VAC and 24 VAC/VDC are on different models. Please specify the desired model when ordering.
2. Multi-inputs. Switch between temperature and analog input using the input type switch. Basic insulation between power supply and input terminals and between power supply and output terminals.
3. Voltage outputs for the E5AR-TQQ $\square \square \square \mathrm{WW}-\square \square \square$ are 21 mA max.

## Controller Performance Specifications

| Indication accuracy | Thermocouple input: <br> ( $\pm 0.1 \%$ of indicated value or $\pm 1^{\circ} \mathrm{C}$, whichever is greater) $\pm 1$ digit max. (See note 1.) <br> [Not using internal cold junction compensation] <br> ( $\pm 0.1 \%$ of indicated value or $\pm 1^{\circ} \mathrm{C}$, whichever is smaller) $\pm 1$ digit max. (See note 2.) <br> Analog input: ( $0.1 \% \mathrm{FS}$ ) $\pm 1$ digit max. <br> Platinum resistance temperature sensor input: <br> $\left( \pm 0.1 \%\right.$ of indicated value or $\pm 0.5^{\circ} \mathrm{C}$, whichever is greater) $\pm 1$ digit max. <br> Position-proportional potentiometer input: <br> $( \pm 5 \% \mathrm{FS}) \pm 1$ digit max. |  |

| Control mode | Standard Control (Heating Control or Cooling Control), Heating/cooling Control Standard Control with Remote SP (Models with 2 Input Channels only) Heating/Cooling Control with Remote SP (Models with 2 Input Channels only) Cascade Standard Control (Models with 2 Input Channels only) <br> Cascade Heating/Cooling Control (Models with 2 Input Channels only) <br> Proportional Control (Models with 2 Input Channels only) <br> Position-proportional Control (Position-proportional Control Model only) |  |
| Control period | 0.2 to 99.0 s (increments of 0.1 seconds): During time-divided proportional control output |  |
| Proportional band (P) | 0.00\% to 999.99\% FS (increments of 0.01\% FS) |  |
| Integral time (I) | 0.0\% to 3999.9 s (increments of 0.1 second) |  |
| Derivative time (D) | $0.0 \%$ to 3999.9 s (increments of 0.1 second) |  |
| Hysteresis | 0.01\% to 99.99\% FS (increments of 0.01\% FS) |  |
| Manual reset value | 0.0\% to $100.0 \%$ (increments of 0.1\% FS) |  |
| Alarm setting range | $\begin{aligned} & \hline-19999 \text { to } 99999^{* 4} \\ & \text { (Decimal point position depends on input type and decimal point position setting) } \end{aligned}$ |  |
| Input sampling period | 50 ms |  |
| Insulation resistance | $20 \mathrm{M} \Omega$ or higher (at 500 VDC ) |  |
| Voltage resistance | 2,000 VAC $50 / 60 \mathrm{~Hz} 1 \mathrm{~min}$ (charged terminals of different polarity) |  |
| Vibration resistance | Vibration frequency: 10 to 55 Hz Acceleration: $20 \mathrm{~m} / \mathrm{s}^{2}$ |  |
| Shock resistance | $150 \mathrm{~m} / \mathrm{s}^{2}$ (relay contacts: $100 \mathrm{~m} / \mathrm{s}^{2}$ ) <br> 3 times each on 3 axes and in 6 directions |  |
| Inrush current | 100 to 240 VAC Model: 50 A max. 24 VAC/VDC Model: 30 A max. |  |
| Weight | E5AR-T | Approx. 450 g (Controller only), Fittings: Approx. 60 g , Terminal cover: Approx. 30 g |
| Weight | E5ER-T | Approx. 330 g (Controller only), Fittings: Approx. 60 g , Terminal cover: Approx. 16 g |
| Degree of protection | Front: NEMA4X indoor, rear case: IP20, terminal plate: IP00 |  |
| Memory protection | EEPROM (Write count: 100,000 times) |  |

Note 1. $\mathrm{K}, \mathrm{T}, \mathrm{N}$ at $-100^{\circ} \mathrm{C}$ max.: $\pm 2^{\circ} \mathrm{C} \pm 1$ digit max.
U and $\mathrm{L}: \pm 2^{\circ} \mathrm{C} \pm 1$ digit max.
B at $400^{\circ} \mathrm{C}$ max. is not specified.
$R$ and $S$ at $200^{\circ} \mathrm{C}$ max.: $\pm 3^{\circ} \mathrm{C} \pm 1$ max.
W: (Larger of $\pm 0.3 \% \mathrm{PV}$ and $\left.\pm 3^{\circ} \mathrm{C}\right) \pm 1$ digit max.
2. $U$ and $L: \pm 1^{\circ} \mathrm{C} \pm 1$ digit
$R$ and $S$ at $200^{\circ} \mathrm{C}$ max.: $\pm 1.5^{\circ} \mathrm{C} \pm 1$ digit
3. Ambient temperature: $-10^{\circ} \mathrm{C}$ to $23^{\circ} \mathrm{C}$ to $55^{\circ} \mathrm{C}$ Voltage range: $-15 \%$ to $+10 \%$ of rated voltage
4. EU stands for Engineering Unit and is the unit after scaling. For a temperature sensor, it is ${ }^{\circ} \mathrm{C}$ or ${ }^{\circ} \mathrm{F}$.

## Sensor Input Setting Ranges and Display/Control Ranges

| Input type | Specification | Setting | Input setting range |  | Display/control range |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Setting Lists

The setting lists give the addresses for CompoWay/F communications and Modbus communications. Refer to the addresses of the protocol that you are using.
The hexadecimal values in the Setting/monitor value column are the setting ranges in CompoWay/F and Modbus communications, and the values in parentheses ( ) are the actual setting ranges.
Monitor and set values can be specified for each channel. Addresses include a channel identifier. The addresses in the variable area maps are for channel 1. To specify addresses of other channels on a Controller with more than one input channel, refer to the table below.

| Channel | Address |  |
| :---: | :--- | :--- |
|  | CompoWay/F | Modbus |
| 1 | Address in setting list | Address in setting list |
| 2 | Address in setting list +0100 | Address in setting list +4000 |
| 3 | Address in setting list +0200 | Address in setting list +8000 |
| 4 | Address in setting list +0300 | Address in setting list + C000 |

## E5 $\square$ R-T Status (Communications)

Note 1. Status is as follows when reading from setting area 1:

- RSP input error:
- Potentiometer error:
- Display range exceeded:
- Input error:
- Control output (heating), control output (cooling):
- Alarm 1, Alarm 2, Alarm 3, Alarm 4:
- AT:
- Run/Reset:
- Auto/Manual:
- SP mode, MV tracking:
- Control output (heating) type, control output (cooling) type:

Cleared
Cleared
Cleared
Cleared
Cleared
Cleared
Cleared
ON (Reset)
Previous value held
Updated
Updated
2. If the FSP Mode is set to "ON," the SP Mode parameter setting (RSP/RSP) is ignored. If the FSP Mode is set to "OFF," the SP Mode parameter setting (RSP/RSP) is valid and the Program SP Mode and Remote SP Mode can be used as required.
3. The control output (heating) status and control output (cooling) status are the open output status and close output status, respectively, during position-proportional control.
4. The control output (heating) status and control output (cooling) status are OFF during linear output.
5. The control output (heating) type status and control output (cooling) type status are OFF when the corresponding output is a voltage output (for driving SSR).

## $\square$ E5 $\square$ R-T Program Status (Communications)

Note 1. Status is as follows when reading from setting area 1:

- Segment Outputs 1 to 10 and Time Signals 1 to 6:
- Hold and Wait
- Program End Output:
- Standby:

Cleared
Clear
Previous value held
Clear
2. Segment Outputs 1 to 10 and Time Signals 1 to 6 status depend on the setting of the Program Output Selection parameter.
3. The Program End Output status will be ON when the display shows Pnd.

Set normalized values based on the input data for the extraction of square root function．
When straight－line approximation is included in the input stage of a K type input for -200.0 to $1300.0^{\circ} \mathrm{C},-200.0$ to $1300.0^{\circ} \mathrm{C}$ is equivalent
to the normalized range 0.000 to 1.000 ．

*1... The currently selected PID Set Number.
*2 .... Not displayed in HMI.
*2 .... Not displayed in HMI.
The maximum is -19999 to 99999 .
Temperature input: Specified range width of sensor input
Analog input: $-110 \%$ to $110 \%$ of scaling range width
The maximum is -19999 to 99999 .
*5 .... The upper limit of the automatic selection range of PID set 8 is fixed at $999.99 \%$ FS for internal data. This can be changed but it will not affect operation.

## Initialization Due to Changing Parameter Settings

Parameters that are initialized when the settings of related parameters are changed are listed in the Related parameter column.

Meaning of Symbols: O: Initialized, -: Not initialized, $\Delta$ : Added channels initialized

|  | Common | Common | CH | CH | CH | Common | CH |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  | $\begin{aligned} & \frac{0}{\circ} \\ & 0 \\ & 0 \\ & \frac{0}{2} \\ & \frac{\overline{1}}{0} \\ & \frac{0}{3} \\ & \hline \end{aligned}$ |
| Condition for not initializing parameters | No assignment | - No assignment <br> - Analog input | Temperature input | Temperature input | - | Position-proportional control | - |
| Scaling Input Values 1 and 2 | O (*2) | - | - | - | - | $\Delta$ | - |
| SP Upper Limit | O (Upper limit of sensor setting range or Scaling Display Value 2) | O (Upper limit of sensor setting range) | O(Scaling Display Value 2) | - | - | $\Delta$ | - |
| SP Lower Limit | O (Lower limit of sensor setting range or Scaling Display Value 1) | O (Lower limit of sensor setting range) | O (Scaling Display Value 1) | - | - | $\Delta$ | - |
| Automatic Selection Range Upper Limit (PV/DV/SP) (PID 1 to 8) | O (*3) | O (*3) | O (*3) | - | - | $\Delta$ | - |
| Remote SP Upper Limit | O (Upper limit of input setting range or Scaling Display Value 2) | O (Upper limit of input setting range) | O (Scaling Display Value 2) | - | - | $\left.\mathrm{O}{ }^{*} 4\right)$ | - |
| Remote SP Lower Limit | O (Lower limit of input setting range or Scaling Display Value 1) | O (Lower limit of input setting range) | O (Scaling display value 1) | - | - | O (*4) | - |

*1: When the control mode is changed, added channels are initialized in the same way as the related parameters for the Input Type parameter ( $\Delta$ on the previous page).
*2: This is the upper and lower limit of the sensor setting range. For a temperature input, this is 4 to 20 mA .
*3: If this is PV or SP based on the PID Set Automatic Selection Data parameter, then (setting upper limit + setting range $\times 0.1$ ); if it is DV, then (setting range $\times 1.1$ ).
*4: Initialized only if the control mode is changed to proportional control (Temperature: Initializes to upper and lower limits of sensor setting range. Analog: Initializes to values set for Scaling Display Values 1 and 2 parameters).
*5: Upper/lower limit of sensor setting range and Scaling Display Values 1 and 2 parameters are initialized.
*6: The default setting is 0 .
*7: The corresponding alarm type numbers in all alarm sets are initialized to 0 .
*8: If the Closed/Floating parameter is set to "Float" for positionproportional control, or if the Operation at Potentiometer Input Error parameter is set to "Continue," this is initialized if the integral time is 0 .
*9: If the applicable channel is used for heating/cooling control, this is $-100 \%$, otherwise it is $0 \%$. (Therefore in cascade heating/cooling control, the primary loop is $0 \%$ and the secondary loop is $-100 \%$.)
*10 All programs and segment parameters will be initialized.
*11 All programs and segment parameters will be initialized when the Number of Segments parameter is changed.
*12 The following segments will be initialized when the Step Time/ Rate of Rise Programming parameter is set to rate of rise programming. (Nothing will be initialized when this parameter is set to step time.)
When Operation at Reset parameter is set to "Control Stop": All odd segments
When Operation at Reset parameter is set to "Fixed Control": All even segments
*13 The following segments will be initialized when the Step Time/ Rate of Rise Programming parameter is set to rate of rise programming. All segments will be initialized when this parameter is set to step time.
When Operation at Reset parameter is set to "Control Stop": All odd segments When Operation at Reset parameter is set to "Fixed Control": All even segments
*14 Initialized only when the Program Output Selection parameter is set for segment outputs.
*15 Initialized only when the Program Output Selection parameter is set for time signals.

Authorized Distributor:

[^11]specifications are subject to change without notice.
Cat. No. H201-E1-03

[^0]:    * Data after scaling is shown in engineering units such as ${ }^{\circ} \mathrm{C}, \mathrm{m}$, and g . "EU" is used to indicate the minimum increment of such a quantity. For example, the minimum increment of 50.02 m is 0.01 m , and thus 1 EU would be equal to 0.01 m .

[^1]:    Set the input type switch according to the setting of the Input Type parameter．
    The default settings are 2 and TC．PT．

[^2]:    ＊： 1 to 4 or 1 to 10

[^3]:    Parameters can be written 100,000 times.
    If you will be writing parameters frequently, set the RAM
    Write Mode parameter (Advanced Function Setting
    Level).

[^4]:    *1.... Set the program number in the Program Editing parameter before setting parameters for individual programs
    *2 .... Depends on the number of inputs and the settings of the Control Mode, Independent Operation/Coordinated Operation,
    and Number of Segments parameters.
    *4 .... Set the segment number in the Segment Editing parameter before setting parameters for individual segments.
    *5 .... Addresses are different for channels 2 to 4 for coordinated operation and channel 2 (secondary side) for cascade
    2 to 4 for coordinated operation and channel 2 (secondary side) for cascade control
    Use channel 1 when setting program data for coordinated operation or cascade control, except for PID set numbers and alarm set numbers.

[^5]:    ＊1．．．RSP is the default for channels 2 to 4 for coordinated operation and channel 2 （secondary side）for cascade control．
    If the Operation at Reset parameter is set to fixed control，FSP is the default for channel 2 （secondary side）for cascade control． When the input type，temperature unit，or scaling display values are changed，settings are initialized as follows： Temperature input：Set upper and lower limits of sensor input
    Analog input：Scaling Display Value 1 （lower limit），Scaling Dis
    Analog input：Scaling Display Value 1 （lower limit），Scaling Display Value 2 （upper limit）

[^6]:    *1 .... Alarm Set Number selected for execution.

[^7]:    *1 .... These are set values for each of the operation functions. Set normalized values based on the input data for the operation function. to the normalized range 0.000 to 1.000 .

[^8]:    *1 .... When the input type, temperature unit, or scaling display values are changed, settings are initialized as follows: Temperature input: Set upper and lower limits of sensor input
    Analog input: Scaling Display Value 1 (lower limit), Scaling Display Value 2 (upper limit)
    *2 .... The maximum number of programs that can be set depends on the setting of the Number of Segments parameter.
    8 segments: 32 programs max.
    12 segments: 20 programs max
    20 segments: 12 programs max
    32 segments: 8 programs max.

[^9]:    |  | Setting/monitor value | Default value (transfer output <br> upper-limit / lower-limit) | Decimal point position/unit |
    | :--- | :--- | :--- | :--- |
    | Present Set Point | SP Lower Limit to SP Upper Limit | $1300.0 /-200.0$ | According to input type/EU |
    | Present Value (PV) | Temperature: Lower limit of sensor setting range <br> to upper limit of sensor setting range | Upper/lower limit of sensor setting range | According to input type/EU |
    |  | Analog: H'FFFFB1E1 to H'0001869F (-19999 to 99999) | Scaling Display Value 2/1 | According to input type/EU |
    | Control Output <br> (Heating or Open) | Standard: H'FFFFFFCE to H'0000041A (-5.0 to <br> $105.0)$ | $100.0 / 0.0$ | $1 / \%$ |
    | Control Output <br> (Cooling or Closed) | H'00000000 to H'0000041A (0.0 to 105.0) | $100.0 / 0.0$ | $1 / \%$ |
    | Valve Opening | H'FFFFFF9C to H'0000044C (-10.0 to 110.0) | $100.0 / 0.0$ | $1 / \%$ |

    The Input Type, Temperature Unit, Scaling Display Value, and SP Upper/Lower Limit parameters are initialized when the corresponding control/transfer output assignment is changed.

[^10]:    ＊1 ．．．．The default is＂PRG＂for models with one input channel and＂CH＂for models with 2 or 4 input channels．
    ＊2 ．．．．The initial setting for the number of enabled channels depends on the model，and is the maximum value of the configuration

[^11]:    In the interest of product improvement
